1.0 INTRODUCTION

E. I. du Pont de Nemours and Company (DuPont) has been conducting soil and groundwater investigation and remediation activities at the Former DuPont Brevard Facility (Site) located in Cedar Mountain, North Carolina for many years. Historically, these activities have been conducted under the Site's Federal Hazardous and Solid Waste Amendments (HSWA) Corrective Action (CA) permit.

Since the start of CA activities in the 1990s, the Site has undergone significant changes, starting with the plant shut-down in 2002, continuing with the complete dismantling and removal of site structures in 2006, and culminating with the State of North Carolina (the State) and DuPont agreeing to work towards the eventual transfer of the Site property to the State, via the NC Department of Agriculture and Consumer Services (NCDA&CS). The NCDA&CS desires use and control of the Site consistent with the surrounding DuPont State Recreation Forest (DSRF), as well as for low-impact training use by the North Carolina National Guard (NCNG). The anticipated future land- and water-use conditions were first presented to DuPont by the NCDA&CS and NCNG in a letter dated February 28, 2014 and have continued to be refined.

The State and DuPont have a mutual desire to affect a transfer of the Site in a safe, timely, and efficient manner. Operating under the assumption that the Site property will be ultimately transferred to the State, DuPont and the State have agreed that it is appropriate to complete the remaining remedial activities under the State's Risk-Based Remediation of Industrial Sites pursuant to N.C.G.S.¹ 130A-310.65 to 310.77 (House Bill 45 or the "Risk Bill").

The Risk Bill requires the completion and submittal of a *Remedial Investigation Report* before final remedial decision-making is appropriate. Based on a review of the significant amount of historical information collected during earlier phases of the CA process and, in context with an updated Site Conceptual Model (SCM) utilizing the future use plans that were provided by the State, it was recognized that an additional phase of field investigation was necessary. To address this, a *Final Remedial Investigation Work Plan* (work plan) outlining the proposed final field investigation activities was prepared and submitted for the State's approval on August 1, 2014. The proposed activities built upon data collected during previous investigations.

This report was prepared on behalf of DuPont to be submitted as the *Remedial Investigation Report* in accordance with Section 130A-310.69 of the Risk Bill. As this report will serve as the final investigation report, it includes details of the historical investigative efforts, as well as details of the recent final remedial investigation activities and a discussion of the updated SCM. The final field investigation activities were conducted in late 2014 and early 2015 in accordance with the approved work plan. In addition, this report includes a discussion of the 2nd Half 2014 (2H14) sampling event that was conducted as part of the routine semi-annual monitoring program established to monitor groundwater downgradient of the Site's Corrective Action Management Unit (CAMU; see Sections 2.5.2 and 6.0).

This report is organized into the following sections:

- Section 1.0 is the introduction, which includes the project goals and objectives.
- Section 2.0 presents an overview of the Site, including summaries of previous investigations and the physical setting.

¹ N.C.G.S. – North Carolina General Statute

- Section 3.0 details the field investigation activities that were conducted at the Site.
- Section 4.0 summarizes the evaluation process that was conducted using the Site's historical and recent analytical data.
- Section 5.0 includes a discussion of the final field investigation results.
- Section 6.0 describes the CAMU sampling activities that were conducted in conjunction with the final field investigation.
- Section 7.0 presents the updated SCM, which was revised based on the data from the final remedial field investigation, from the CAMU sampling program, and from previous investigations completed at the Site.
- Section 8.0 lists the conclusions and recommendations developed during the final remedial investigation.
- Section 9.0 provides the references used during preparation of this report.

1.1 Overall Site Remediation Goals

As stated above, DuPont has been conducting soil and groundwater investigation and remediation activities at the Site for many years under the Site's HSWA CA permit. DuPont developed several overall remedial goals for the Site to help drive and focus the CA activities. These goals included the following:

- Protection of people and the environment through the development and use of a SCM that is based on a thorough understanding of the Site constituents, release pathways, and exposure potential;
- Cost-effective management/minimization of long-term liabilities associated with the potential contaminant releases using a risk-based prioritization process;
- Compliance with regulatory requirements; and
- Coordination of CA activities with other business activities at the Site to minimize disruption to facility operations, maximize benefits and synergies with other, overlapping environmental initiatives, and ensure field efforts are conducted in a safe and efficient manner.

Triggered by the desire to affect a transfer of the Site to the State, the overall remediation goals have been modified and updated to now include the following:

- Ensuring ongoing protection of people and the environment through active and administrative measures;
- Ensuring the State can achieve desired future land use; and
- Meeting regulatory obligations and public expectations.

The final field investigation activities described in this report were conducted to help meet these goals.

1.2 Final Investigation Project Objectives

DuPont developed the following project objectives for the final phase of investigation:

- Identification of remaining data gaps necessary to meet the overall remedial goals;

- Development and implementation of a *Final Remedial Investigation Work Plan* to address the identified remaining data gaps;
- Development of site-specific remedial levels (RLs) based on the Risk Bill requirements for use in future data evaluation; and
- Development and submittal of a final *Remedial Investigation Report* to support final remedial decision-making via the submittal of a proposed *Remedial Action Plan*.

It is DuPont's intention that, upon approval of this report, DuPont will have met the investigation reporting requirements of the Risk Bill and will be able to move forward with final remedial decision-making and preparation of a *Remedial Action Plan* (RAP) in accordance with Section 130A-310.69 of the Risk Bill. Although additional data gaps pertaining to SWMU 17 exist, this SWMU is currently the subject of ongoing consideration for implementation of a remedial action. Therefore, while the groundwater surrounding SWMU 17 was investigated during this final field effort, additional investigation of this SWMU will be conducted in a separate effort to support unit-specific remedial decision-making.

2.0 SITE OVERVIEW

This section presents an overview of the Site including a summary of the numerous historical investigations that have been conducted and information about the Site's physical setting.

2.1 Site Location and Boundaries

The Site is located in Cedar Mountain, Transylvania County, North Carolina, approximately six miles southeast of the town of Brevard and three miles north of the South Carolina state line. The local area is characterized by relatively high relief, with local elevations ranging from 1,010 to 4,000 feet above mean sea level (MSL). The Site sits atop a plateau at 2,550 feet above MSL (Figure 1). It is bounded by the Little River on the south and east and heavily wooded mountain land to the north (DuPont CRG 2004). The property is entirely surrounded by the DSRF property.

2.2 Site Background

The Site history and environmental setting is briefly summarized below. Additional information about the background of the Site can be found in the *Phase III RCRA Facility Investigation Report* (Parsons 2009) and the *Final Remedial Investigation Work Plan* (Parsons 2014).

2.2.1 Plant Site Operations

DuPont began operations at the Site in 1957 producing high purity silicon under the Chemicals and Pigments (C&P) Department during the first five years of operation. The property was then transferred to the Imaging Department for production of medical imaging (x-ray) films. In addition to manufacturing processes, DuPont historically operated a powerhouse, a wastewater treatment facility, a Save-All System (silver recovery unit), the Alternate Fuel Boiler (AFB), and permitted solid waste landfills.

The manufacturing area was divested to Sterling Diagnostic Imaging Inc. (Sterling) on March 29, 1996. On May 14, 1999, Sterling divested the manufacturing facility to AGFA Corporation. Both AFGA and Sterling conducted the same operations as DuPont. AGFA discontinued operations at the DuPont Brevard Facility in December 2002.

Following closure of Site operations, AGFA and DuPont engaged in negotiations pertaining to future reacquisition of the property by DuPont. The purpose of this reacquisition was to maximize control of potential environmental liabilities that DuPont retained on this and the adjacent property that DuPont still owned. An agreement was reached with AGFA to perform demolition and removal (D&R) activities for major assets of the facility in February 2004, prior to DuPont reacquisition of the property. All required D&R activities were completed in May 2006, and ownership of the Site was divested to DuPont in July 2006.

2.2.2 Regulatory History

The Brevard facility has been in the Resource Conservation and Recovery Act (RCRA) hazardous waste program since 1980. RCRA Corrective Action (CA) at the Site has been conducted in accordance with the requirements set forth in the Site's permits. The current permit is the Hazardous and Solid Waste Amendments (HSWA)-only Hazardous Waste Management Permit No. NCD003152329 R-2 issued by the North Carolina Department of Environment and Natural Resources (NCDENR) on August 4, 2008, and

revised on April 11, 2011. The current permit lists 20 solid waste management units (SWMUs) and 11 areas of concern (AOCs) as present on-site. The locations of these units are shown in Figure 2.

The CA program requires investigation and cleanup of releases of hazardous constituents that pose an unacceptable risk to people and the environment. Numerous historical investigations have been completed at the Site. In 2002, DuPont began conducting a RCRA Facility Investigation (RFI) in a phased approach in an effort to efficiently expedite the transition to remedial measures and closure. RFIs are designed to characterize releases of constituents from regulated units, SWMUs, or other areas at the facility through the collection and evaluation of data. The history associated with the submittal and approval of various RCRA CA documents has been discussed in previous reports submitted to NCDENR. The most recent phase (Phase III) of the RFI was completed in 2009, and the results and conclusions drawn from the Phase III activities were presented in the *Phase III RFI Report*, which was submitted to NCDENR on September 30, 2009. The existing site monitoring well network is shown on Figure 3. Additional information about the historical investigations completed at the Site is presented in Section 2.3 below.

In September 2012, an evaluation of the environmental indicator for "current human exposures under control" (EI RCRIS Code CA725) and an evaluation of the environmental indicator for corrective action "migration of contaminated groundwater under control" (EI RCRIS Code CA750) were prepared for the Site (Parsons 2012a, 2012b). The EI determination evaluations were completed in accordance with the guidance established by the United States Environmental Protection Agency (USEPA) (1999). The EI determination process concluded that releases or the potential for releases identified from RCRA CA units at the Site do not constitute a significant threat to human health. Reasonably expected exposures from potentially complete exposure pathways were found to be insignificant, and the potential for exposure is prevented or controlled. As a result, a positive EI determination for EI CA725 was reached. In addition, the EI determination process concluded that the migration of contaminated groundwater has stabilized and groundwater releasing to surface water is not significantly impacting surface water bodies at and adjacent to the Site. As a result, a positive EI determination for EI CA750 was also reached.

2.3 Previous Investigations

In February 1996, a *RCRA Facility Assessment* (RFA) was submitted to NCDENR that identified 20 SWMUs and three AOCs at the Site (DuPont Environmental Remediation Services [DERS] 1996b). Based on the RFA, six SWMUs were identified as needing confirmatory sampling (CS) to determine whether they were releasing regulated substances into the environment. As part of the original plant divestiture in 1996, DuPont completed closure activities on the permitted storage pad. DuPont closed the North Landfill in 1993 and received official approval of closure from NCDENR on August 22, 1996. In addition, DuPont completed closure activities at the East Landfill in late 1996. An engineering evaluation (dated March 28, 1997) was used in lieu of CS at SWMU 10, and the status of the SWMU was changed to No Further Action (NFA) in a letter from NCDENR dated May 14, 1997.

A *Confirmatory Sampling Work Plan* was produced (originally submitted in October 1996, revised in September 1998) that provided the scope and schedule for completion of the outstanding CS activities. However, after the CS work plan was drafted, the RCRA CA program evolved to provide for more flexible, results-oriented approaches and

became less focused on process-related activities. Since the CS work plan was written only to address a limited number of units and would have primarily satisfied a process requirement, a request was made by DuPont to take an alternative approach. A joint DuPont and NCDENR meeting was held in June 2001, and it was agreed that a more holistic approach was appropriate for the Site. In a letter dated July 13, 2001, DuPont requested that the formal approval of the draft CS work plan be withheld and a more risk-based, holistic approach, consistent with the current RCRA reforms efforts, be pursued instead.

On January 18, 2002, as the first step in this alternative approach, DuPont submitted a *Current Conditions Report (CCR)* to NCDENR (DuPont CRG 2002). The CCR summarized the data collected from historical investigations completed at the Site since 1986. A preliminary SCM was also presented, which indicated that the constituents present appeared to be stable and were not perceived as an immediate threat to human health or the environment. A risk-based approach using a phased RFI was initiated in lieu of the more focused and limited scope that had been originally proposed in the CS work plan.

Phase I of the RFI was completed in a two-stage effort. Stage I consisted of three elements completed to gain a better understanding of geologic and hydrogeologic conditions across the Site. These elements included installing soil borings and piezometers across the Site, installing two staff gauges at Lake DERA and Little River, and collecting water level data. A Technical Memorandum summarizing the findings of Stage I of the Phase I RFI and proposed recommendations for Stage II activities was submitted to NCDENR on December 31, 2002. Stage II field activities were completed on October 17, 2003, and consisted of filling data gaps identified from Stage I of the RFI. Background soil samples were collected, and a groundwater investigation of the surficial aquifer was conducted along with a release confirmation investigation of SWMU 17. The conclusions of the Phase I RFI can be found in the *Phase I RCRA Facility Investigation Report* (DuPont CRG 2003).

The RFI Phase II was conducted from May through August 2004. The goals of the Phase II were to investigate the CA units and former manufacturing areas and fill data gaps associated with the site-wide groundwater monitoring program. More groundwater monitoring wells and soil borings were installed, soil samples, groundwater samples and surface water samples were collected, and water levels were measured. The conclusions of the Phase II RFI can be found in the *Phase II RCRA Facility Investigation Report* (DuPont CRG 2004).

In 2006, DuPont initiated a number of investigative tasks to expand the hydrogeologic data set for the Site in order to facilitate planning the scope for the Phase III RFI. These investigative tasks included establishing a new geo-reference baseline for the Site, sampling select groundwater and surface water points, and completing fracture trace analysis and a borehole geophysical evaluation of bedrock wells on-site. Preliminary results of this work were discussed with NCDENR during a meeting held at the Site in October 2006. Based on the outcome of the meeting, DuPont submitted the *Phase III RFI Work Plan* to NCDENR on February 5, 2007. The work plan presented the goals for the next phase of the RFI and incorporated the newly-acquired investigation results from the activities described above.

A January 2007 site-wide groundwater sampling event was conducted, including the sampling of the North Carolina DuPont State Forest Service (NCDSRF) Visitor Center water supply well (WSW). Organic compounds were detected in the visitor center well

during this event, and evaluations of the analytical results prompted completion of additional Phase III activities as outlined in the *Phase III RFI Work Plan Addendum*, which was submitted on May 14, 2007.

Following the Phase III work plan addendum submittal, several proposed Phase III RFI field activities commenced in fall 2007. These primarily consisted of SWMU 17 source-area and groundwater quality investigation activities. DuPont submitted an *Interim Phase III RFI Report* on February 29, 2008, which discussed the activities conducted to that point. The activities included a soil gas survey and groundwater and surface water sampling events. Resulting information from these activities was used to refine the SCM, which demonstrated that the Site remained protective of human health and the environment. Full analytical details and results can be found in the *Interim Phase III RFI Report* (DuPont CRG 2008).

The *Interim Phase III RFI Report* recommended the completion of follow-up activities related to SWMU 17 and the compounds (potentially related to SWMU 17) that had been detected in the NCDSRF Visitor Center WSW. The follow-up activities were conducted between early 2008 and 2009, and a discussion of the results was presented in the *DuPont State Forest Service Visitor Center Interim Measure Report*, which was submitted to NCDENR in June 2009 (DuPont CRG 2009). The completed activities included soil gas sampling and an evaluation of potential exposure points in surface water at locations topographically downgradient of SWMU 17. Concurrent with these activities, DuPont also designed a water treatment system for the NCDSRF Visitor Center WSW (see Section 2.5.1).

Remaining Phase III activities (site wide) were continued in fall 2008. These activities included the installation of bedrock and residuum² groundwater monitoring wells, groundwater and surface water sampling, former manufacturing area investigations, background soil sampling, and vapor intrusion activities. On February 3, 2009, DuPont submitted the *Phase III RFI Project Update* letter to summarize the completed *Phase III RFI Work Plan* activities and completion of each proposed modification to the original work plan objectives. Results and conclusions drawn from these activities are discussed in the *Phase III RFI Report*, which was submitted on September 30, 2009.

Based on a review of the significant amount of historical information collected during earlier phases of the CA process and, in context with the updated SCM utilizing the future use plans that were provided by the State, an additional phase of field investigation was deemed necessary to fulfill several data gaps that remained after the completion of the Phase III RFI. As previously stated, DuPont and the State agreed that the remaining investigation activities would be completed under the State's "Risk Bill," and the additional field investigation activities that are described in this report were conducted in accordance with the *Final Remedial Investigation Work Plan* (August 1, 2014).

2.3.1 Historical Documents

A list of the most relevant historical investigation project documents is provided below. Additional information about the activities that have been conducted at the Site can be found in these documents:

- *RCRA Facility Assessment*. Former DuPont Brevard Facility. DuPont Environmental Remediation Services (DERS), February 1996.

² Residuum at the Site is defined as saprolite and partially weathered rock (PWR) zones.

- *Confirmatory Sampling Work Plan*. Former DuPont Brevard Facility. DERS, originally submitted in October 1996, revised in September 1998.
- *Current Conditions Report*. Former DuPont Brevard Facility. DuPont Corporate Remediation Group (CRG), January 18, 2002.
- *Phase I RFI Report*. Former DuPont Brevard Facility. DuPont CRG, December 31, 2003.
- *Phase II RFI Report*. Former DuPont Brevard Facility. DuPont CRG, December 2004.
- *Interim Phase III RFI Report*. Former DuPont Brevard Facility. DuPont CRG, 2008.
- *Phase III RFI Report*. Former DuPont Brevard Facility. Parsons, 2009.
- *DuPont State Forest Service Visitor Center Interim Measure Report*. Former DuPont Brevard Facility. DuPont CRG, 2009.
- *Interim Measures Report*. Former DuPont Brevard Facility. Parsons, 2012.
- Environmental Indicator for “current human exposures under control” (EI RCRIS Code CA725). Former DuPont Brevard Facility. Parsons, 2012.
- Environmental Indicator for corrective action "migration of contaminated groundwater under control" (EI RCRIS Code CA750). Former DuPont Brevard Facility. Parsons, 2012.
- *Final Remedial Investigation Work Plan*. Former DuPont Brevard Facility. Parsons, August 1, 2014.

2.3.2 SWMU and AOC Summary

The current permit lists 20 SWMUs and 11 AOCs as present on-site. The locations of these units are shown on Figure 2. A summary of each unit including the unit name, description, and dates of operation is included in Table 1.

2.4 Demolition and Removal Activities

Following closure of Site operations in 2002, AGFA and DuPont engaged in negotiations pertaining to future reacquisition of the property by DuPont. The purpose of this reacquisition was to maximize control of potential environmental liabilities that DuPont retained on this and the adjacent property that DuPont still owned. An agreement was reached with AGFA to perform D&R activities for major assets of the facility prior to DuPont’s reacquisition of the property.

Throughout the D&R effort, site personnel documented preconstruction, area-specific preparation efforts and post-cleaning certifications. Photographic documentation of pre- and post-demolition conditions was also compiled. Special waste and other materials removed from the Site include asbestos, lead-based paint, mercury switches, light ballasts (polychlorinated biphenyl [PCB] and non-PCB), residual material in vessels, hydraulic fluids, gearbox oils, halons, and batteries. All debris was segregated into like material (e.g., concrete, aluminum, copper, carbon steel, and stainless steel). Sorted metal debris was removed from the Site and transported to a reclamation center. Other demolition debris was disposed offsite at a properly-permitted landfill.

During the D&R, it was determined that some sub-structures (e.g., slabs) would not be removed. To ensure that these assets did not create a potential for future hazards, some of the remaining slabs were cleaned based on process knowledge and visual inspection after the above-ground structures were demolished. Cleaning involved pressure washing at 3,000 pounds per square inch (psi) and using mechanical removal (scraping) followed by a clean water rinse. All wash and rinse water was collected, containerized, and sampled prior to disposal. These samples were analyzed for total concentrations of constituents determined based on operation knowledge of the area. Sample analyses were compared to applicable screening criteria (e.g., drinking water and surface water regulatory standards) to determine if the cleaning operation had removed potential contamination. Slabs where cleaning generated wash and rinse water that exceeded regulatory requirements were washed and rinsed a second time and sampled/analyzed again. This process was repeated until the regulatory criteria were met or until it was decided that the slab should be properly removed and disposed of. In total, approximately 16 slabs, pads, or foundations were completely removed from the Site during these activities.

All sewers within the Site were cleaned and closed during the effort. Three types of sewers were identified on the property (storm, process, and sanitary). The cleaning effort involved either power washing with a 3,000 psi pressure washer or gravity flushing with a large volume of water. The resulting water was sampled and analyzed for priority pollutant constituents for proper disposal. If the results were within site-specific NPDES³ limitations, then the water was discharged to the Wastewater Treatment Plant (WWTP). If the results were above the site-specific limitations, then the water was transported off-site for disposal. Sewer and manhole closure involved either abandoning the pipe and filling the pipe and manholes with an inert material or removal. All other underground piping (water, gas, fire protection) were capped at grade and abandoned. Remote inspection was performed on 30% of the total length of sewer pipe where inspection was possible using an electric remote-control robot equipped with a camera. In all, 3,500 linear feet of sewer pipe, 1,500 linear feet of process sewer, and 2,000 linear feet of storm sewer were inspected and videotaped. None of the inspection reviews indicated significant accumulation of debris or staining in the pipes, which led to the approval of closure activities.

The WWTP was closed during the D&R effort. Over 2,563 tons of biosolids were removed from the WWTP emergency spill, aeration and settling basins using a barge-mounted diesel dredge. In addition 1,085 tons were removed from the diversion basin. All removed solids were filtered and disposed offsite in a permitted landfill. Testing of residual solids and underlying soils did not indicate any potential future environmental concerns. Approximately 60,000 cubic yards of soil were used over nearly 25 acres to grade and cap the completed area to create proper drainage. Based on pre-closure sampling analysis, AGFA and DuPont determined that the biosolids in the Polishing Pond could remain in place. The Polishing Pond was drained, and the sludge was dewatered and solidified. A non-woven, needle punched geotextile fabric was installed over the solidified sludge. Three feet of cover soil was placed over the geotextile fabric and compacted. The final grade of the polishing pond is at a 1.2% slope to minimize accumulation of surface water.

The D&R project was performed in accordance with the Erosion and Sediment Control Plan approved by the North Carolina Soil Conservation District (Permit number TRANS-

³ NPDES – National Pollutant Discharge Elimination System

2005-012). Erosion and sediment controls were established at the beginning of the demolition effort and continued throughout the project. The three primary areas of erosion control efforts were around storm sewer intakes, the piles of demolition debris that could be eroded by water or wind, and the areas where demolition was completed. Following the D&R activities, areas that had been disturbed were stabilized by hydro-seeding and broadcast seeding. Areas of the Site receiving final grading included leftover parking lots, concrete slabs, gravel areas, and grass areas. The Site was inspected to identify and eliminate possible depressions where surface water could accumulate. All gravel areas were graded to achieve positive drainage of surface water. Any disturbed or borrow areas used in the effort were stabilized before project end.

All required D&R activities were completed in May 2006. Estimates indicate that approximately 32,370 tons (75,530 cubic yards) of material were removed from the Site in 2,158 truck loads. In July 2006, following completion of the D&R activities, ownership of the Site was divested to DuPont. Records of the D&R effort were incorporated into a report and are on file at the Site. These records include building inspections, photographic documentation of material removal, sewer video inspection reports, chemical analytical results, maps showing residual foundations/slabs, and final grading elevations.

2.5 Completed Interim Remedial Measures

2.5.1 NCDSRF Visitor Center Interim Remedial Measure

As part of the Phase III RFI effort and in accordance with DuPont's goal of protection of people and the environment, DuPont performed groundwater sampling in January 2007 on the off-site NCDSRF Visitors' Center WSW upon notification of future use by NCDSRF personnel. Only one compound (trichloroethylene [TCE]) was detected at a concentration that exceeded the 15A North Carolina Administrative Code (NCAC) 2L .0200 (NC2L) value. This exceedance led to the initiation and completion of additional investigative and remedial activities. An addendum to the *Phase III RFI Work Plan* was submitted on May 14, 2007, communicating the results of the January 2007 sampling of the NCDSRF WSW and outlining additional activities proposed to be completed during the Phase III RFI with respect to the detection of site-related compounds (potentially related to SWMU 17) in the NCDSRF WSW. The work plan addendum recommendations included the collection of additional groundwater samples from the WSW to confirm the results of the January 2007 sampling event and installation of a carbon treatment unit (capable of removing constituents that exceeded NC2Ls) on the NCDSRF Visitor Center WSW, prior to placement of the well in service as a potable water source.

An *Interim Phase III RFI Report* was submitted on February 29, 2008, which presented the findings of the activities described in the work plan addendum. The results from a groundwater sample collected in September 2007 confirmed the detections observed in the NCDSRF WSW during the January 2007 sampling event. In addition, concentrations of TCE detected in the WSW did not exceed calculated indoor air screening levels protective of potential receptors (i.e., visitor center worker); therefore, indoor air was excluded as a media of concern at the NCDSRF Visitor Center. The report recommended implementation of remedial actions including the installation of a carbon treatment unit along with post-treatment groundwater monitoring prior to well use to address the concentration of TCE that exceeded the NC2L standards in the WSW.

DuPont voluntarily designed a granular activated carbon (GAC) water filtration treatment system for the NCDSRF Visitor Center WSW as an interim remedial measure (IRM) to ensure a safe water supply to Site workers, the visitor center, and restrooms. In January 2009, DuPont, in concert with the NC Forest Service, installed the GAC water treatment system at the NCDSRF Visitor Center. To confirm that the system is functioning as designed, DuPont implemented a proactive sampling regime. Confirmation samples of the water flowing from the treatment system were collected on a monthly basis for a four month period after the restrooms were opened to the public. Then the sampling frequency was reevaluated and adjusted accordingly. The current sampling program consists of annual GAC filter change-outs and semi-annual sampling of water from the system. The *DuPont State Forest Service Visitor Center Interim Measure Report* submitted to NCDENR in June 2009 presents additional details about the IRM activities (DuPont CRG 2009).

The GAC filters were last changed-out on September 23, 2014, and the most recent semi-annual analytical samples were collected from the pre-filter, primary filter, and secondary filter locations of the system on April 17, 2015. A letter report summarizing these activities will be submitted to NCDENR once the final analytical results are received and reviewed by the project team. The ongoing results of the semi-annual monitoring program indicate that the GAC system remains effective at removing VOC constituents in groundwater used as a water supply for the NCDSRF Visitor Center.

2.5.2 SWMU 11 and SWMU 14 Interim Measure Activities

One of the former Site processes was the manufacture of medical imaging (x-ray) film, also known as polyethylene terephthalate (PET). Nonhazardous, off-specification and process startup waste PET film produced at the facility was previously deposited into two SWMUs that were under investigation as part of the facility's CA program. These units are SWMU 11 (the former East Landfill) and SWMU 14 (the former ball field area), both of which are depicted in Figure 2.

The Site historically operated the East Landfill as a permitted landfill under Permit #88-06 issued pursuant North Carolina's RCRA Solid Waste Regulations (15A.13B.0505). The former East Landfill (now SWMU 11) was originally opened in 1972 under state approval as per the North Carolina Board of Health "Rules and Regulations Providing Standards for Solid Waste Disposal." The East Landfill stopped receiving waste in 1996 and was officially closed per the approved East Landfill Closure Plan (DuPont DERS 1996a). State approval of the closure was granted on August 22, 1996, and reaffirmed on May 21, 2001. Oversight of the post-closure activities was transferred from the NCDENR Solid Waste Section to the Hazardous Waste Section on June 30, 2004, in recognition of the RCRA CA permit designation of the landfill as a CA SWMU. The former ball field area (now SWMU 14) was an open area used to dispose of various wastes generated during the manufacturing process between 1958 and 1972. The area was reclaimed and used as a ball field during DuPont ownership. The ball field had not been used since DuPont reacquired the Site in 2006.

An important consideration to progress the Site toward completion of the original remediation goals was a plan to consolidate certain waste materials from other areas of the Site into the former East Landfill (SWMU 11). In order for this plan to be allowed, the State required DuPont to establish a CAMU at SWMU 11 to act as the consolidation location for nonhazardous materials from other areas of the Site. DuPont submitted the SWMU 11 CAMU Application on April 20, 2010, and a revised application on October

29, 2010. NCDENR approved the establishment of the CAMU via a modification to the RCRA permit on April 21, 2011.

An interim measure (IM) removal/consolidation effort using the CAMU was carried out at the Site between June 2011 and July 2012 in accordance with the Interim Measures Work Plan (WRScompass 2011), which was approved in April 2011. Plastic material from SWMUs 11 and 14 was removed, and where possible, the waste PET material was recycled. The remaining acceptable remediation waste material (RWM) from SWMU 14 was then placed into the CAMU. During the effort, approximately 9,771 in-place cubic yards of PET material from SWMU 11 and 6,140 in-place cubic yards of PET material from SWMU 14 were shipped off-site for recycling. Approximately 80,665 in-place cubic yards of acceptable RWM was removed from SWMU 14 and placed into the SWMU 11 CAMU.

An interim landfill cap had been constructed over the SWMU 11 CAMU by the end of July 2012 according to the specifications detailed in the CAMU application. The *Interim Measures Report* (Parsons 2012c) describes these activities in detail. Semi-annual, post-closure groundwater and surface water monitoring was started in the second half of 2012 and is ongoing.

The most recent *Interim CAMU Groundwater Monitoring Report* summarizing the ongoing semi-annual, post-closure groundwater and surface water monitoring was submitted on March 13, 2014. The report summarized the data collected during the first three completed semi-annual interim CAMU sampling events, and confirmed that the RWM that was placed into the CAMU has not affected the quality of the surrounding groundwater and is not adversely impacting human health or the environment. Additional information about the CAMU monitoring program is included in Section 6.0.

2.6 Physical Setting

The following sections describe the physical setting and attributes of the Site. Additional details about the Site environmental setting can be found in the historical investigation documents listed in Section 2.3.1 above.

2.6.1 Regional Physical Setting

Regional Climate

Transylvania County has a moderate climate with a relatively high average precipitation totals. The warmest month is July, with an average high of 83 degrees Fahrenheit (° F). The coolest month is January with an average low of 24° F. The winter months of December and January have the two highest average precipitation amounts at 6.38 and 6.4 inches, respectively. The average annual precipitation is approximately 64 inches.

Regional Geology

The DuPont Brevard facility is situated along the boundary between the Blue Ridge and Inner Piedmont Physiographic Provinces. The Brevard Fault Zone, a one-third to two-mile-wide zone of highly broken mylonitic rock, separates the Blue Ridge from Inner Piedmont rocks and trends along northern portions of the site (South Carolina Geological Survey 2007).

The property sits atop the largest granitic pluton in western North Carolina. Crystalline rocks approximately 438 to 447 million years old form this structure. Rocks north of the Slicking Gap Fault are classified as Henderson Granitic Gneiss. This rock is described

as a medium gray, medium- to coarse-grained granoblastic matrix with large megacrysts (augens) of microcline, and lepidoblastic; layers are massive to well foliated and mylonitic in places. To the south of the fault, rocks are identified as belonging to the Table Rock Gneiss and described as white to medium gray, medium- to coarse-grained, granoblastic, weakly foliated to foliated, locally mylonitic (North Carolina Geological Survey 2011). Fracturing may be seen in both formations.

Regional Hydrogeology

A regolith consisting of soil, saprolite, and weathered rock commonly is found above crystalline rocks found near the DuPont facility. Porosity of this weathered material is much higher (between 20 to 30 percent) than the crystalline rock (except maybe along fracture zones in the rock); groundwater is therefore likely to be in greater storage in the regolith compared to fractured bedrock (U.S. Geological Survey 1997). Flow from the weathered material is mainly via pore space and follows topographic trends. Groundwater flow in the residuum is not hydraulically distinct from flow in the underlying bedrock because the source of groundwater within the fracture is believed to be drainage from the overlying residuum (Heath 1980). The crystalline nature of the granite and gneiss result in very low primary porosity. Groundwater flow direction and rate are governed by the orientation and size of fractures, faults and foliation planes within the bedrock. Fracture openings are generally less than one percent of the rock volume, and water-bearing fractures are uncommon at depths greater than 300 feet below surface.

2.6.2 Local Physical Setting

The following paragraphs describe the local physical setting for the Site based on the findings of Site investigations.

Site Topography

The Site rests on top of a granitic plateau that contains some undulations in slope and generally trends downslope from northwest to southeast. Higher land elevations (over 2600 feet above MSL) along the property occur along the northwest portion of the Site near Lake DERA, with elevation decreasing to less than 2525 feet above MSL eastward along Little River. Land along the river often is seen as reasonably flat outwash with slopes significantly increasing on off-site lands east and south of the river.

Site Geology

Overburden

The interval ranging from ground surface to the top of the saprolite unit has been described as the sitewide soils. According to the Soil Survey for Transylvania County (U.S. Department of Agriculture Soil Conservation Service and Forest Service 1974), the majority of the soils beneath the site are from the Ashe Series and Chester Series. Both series consists of very well drained soils “under forest vegetation in residuum derived from gneiss or granite.” The overburden soil materials lack the obvious intact structural appearance of the underlying weathered-in-place bedrock (saprolite). Overall, material across the Site has been determined to consist of mostly silty sands and sandy silts with varying colors ranging from black or hydric in appearance, to tan, grayish, yellow-orange, and brown with intermixing and noted gradations. Historical borings advanced near Little River have yielded overbank deposits with more fine to medium sands, with a lesser silt content and abundant gravel (Parsons 2009).

Overburden material on Site ranges from 0.25 feet thick to approximately 20 feet thick. Thick overbank deposits have been found in close proximity to Little River. The thinnest

sections located during the Phase III RFI were found along topographic high regions such as at SWMU 17. Additional borings more centrally located in the Western portion of the former manufacturing area have been found to have varying deposits ranging from less than one foot to approaching 20 feet. These borings, however, are subject to displaying a false representation of the actual thickness due to displacement of overburden during previous building construction and removal efforts (Parsons 2009).

Residuum

Residuum at the Site is defined as saprolite and PWR zones. The following sections discuss the composition and occurrence of both. Residuum thickness, combined with overburden, can easily be correlated to the relief of the underlying outcrop (Parsons 2009). Residuum is less thick where there is an elevated section of bedrock, such as near SWMU 17 and southeast and southwest of Lake DERA. The residuum is thicker in the valley sections of bedrock. This is most likely because the groundwater flow follows the topography of bedrock, with a saturated thickness being greater in the “valley” areas of the bedrock. These saturated conditions are favorable for in-situ chemical weathering and would therefore produce thicker residuum.

Saprolite

Saprolite is defined as weathered bedrock that is in-situ and maintains the mineral fabric of its parent material. Saprolite was observed in every monitoring well, piezometer and boring advanced at the Site. Saprolitic materials observed at the Site are defined by their characteristic banding of white and tan matrix materials (predominantly fine sands and silt) with dark banding materials (predominantly micas) as seen in the gneissic banding of the parent rock. As mentioned above, saprolite is observed to be thicker in the valley regions between elevated regions of bedrock. Saprolite exhibits more variability in the western half of the Site where there is considerably more relief in topography. The eastern area of the Site contains more valley topography and therefore thicker and more uniform distributions of saprolite.

Partially Weathered Rock

PWR is compositionally the same as the unconsolidated saprolite, but contains more competent material such as rock fragments. Thicknesses range from 4.5 feet to 26 feet across the Site, with the greatest thickness being below the former manufacturing area of the Site. The most recent cross-sections combining Phase III RFI and historical boring data do not support a pattern of PWR thickness in the valley regions (as with the saprolite and overburden) (Parsons 2009).

Bedrock

The installation of seven bedrock wells during the Phase III RFI activities provided an opportunity to observe notable distinctions in the fabric and mineral size that corresponded to three general categories of bedrock. North of SWMU 17, the gneiss was particularly phaneritic with large augens distributed throughout the matrix, occupying approximately 20% of the material. Biotite and feldspar were more abundant than quartz, making the rock more friable than that observed in the borings along Little River. The monitoring wells installed along the southeast and southern portions of Little River are located in gneiss that is more aphanitic. This rock was more durable and appeared more competent than that seen in the vicinity of SWMU 17. Bedrock material present in monitoring well BR-4 had a higher quartz content, and was very hard and competent. The minerals were larger than those seen in BR-1 through BR-3, and there were several pockets of large potassium feldspar.

Each boring contained at least one or two physically observable fractures coated in an iron-oxide or limonitic staining, indicating the presence of water. Most of the fractures were at an angle that roughly paralleled the foliations in bedrock, but some were nearly vertical (Parsons 2009).

Site Hydrogeology

Overall Site hydrogeology has been determined by reviewing updated potentiometric surface maps (Figures 4 through 6), along with unit thickness maps and the Bedrock Surface Contour Map generated during the Phase III RFI (Parsons 2009). In addition, data was assimilated from the slug testing conducted on 32 wells and a borehole geophysical investigation conducted on the seven bedrock wells and data from past RFI events.

Groundwater Elevations

Groundwater elevations measured across the Site on November 3, 2014 (Table 2), ranged from 2565.00 to 2495.05 feet above MSL. Groundwater elevations are highest on the western portion of the Site; the lowest on the eastern side of SWMU-14 and along Little River, the eastern Site boundary.

As indicated from the 2009 vertical hydraulic gradient calculations in the Phase III RFI report, the western portion of the Site (west of the former manufacturing areas) experienced predominantly downward flow from the shallow aquifer to the bedrock aquifer. The eastern half of the Site showed predominately upward flow from deep soil/bedrock to shallow soils. Vertical gradient calculations using the data collected during the final investigation indicate that the reverse is occurring: on the western portion of the site, groundwater is predominately upward flowing from the bedrock aquifer to shallow soils, and on the eastern portion of the site groundwater is predominately downward flowing. This difference from the 2009 event may be a result of fluctuations in rainfall.

Surficial Aquifer

As discussed in previous RFI reports, the surficial aquifer is defined by the saprolite/partially weathered rock material and the overburden deposits adjacent to Little River. The overall flow pattern within the surficial aquifer continues to be across the Site in a previously defined east to southeasterly direction. Surficial groundwater also appears to flow radially from the bedrock mound beneath the SWMU 17 area. Groundwater gradients move in a manner that follows bedrock topography. Horizontal gradients are noted to be the steepest in areas where bedrock topography is greatest and lowest where the topography begins to level off in the presence of Little River. The thickest saturated zones of the surficial aquifer reside within the valleys between high points in the bedrock (Parsons 2009).

Bedrock Aquifer

Seven bedrock wells averaging in depth from 69 to 100 feet below ground surface (bgs) were installed during the Phase III RFI and were observed in conjunction with the six existing water supply wells (averaging in depth from 60 to 420 feet bgs). Flow patterns observed in the potentiometric surface maps depicted a relatively uniform horizontal gradient toward the southeast.

A borehole geophysical investigation was conducted by Golder Associates after the bedrock wells were installed in order to investigate the borehole fractures within the bedrock. The Golder report concluded that during flow-meter measurements, only a few

individual fractures or sets of fractures produced virtually all inflow to these boreholes during pumping. Final results from the borehole geophysical analysis performed on the seven bedrock locations installed during the Phase III RFI (Golder Associates 2009) and WSWs (Golder Associates 2006) revealed the following interpolations:

- There are hundreds of possible permeable fractures in the wells; however, only a few were identified as sets of fractures that produce the majority of the inflow as determined by the tested boreholes.
- Such water producing fractures showed a tendency to be horizontal in nature, dipping toward the southwest at a moderate angle (Golder Associates 2006).
- Fractured zones are shallow dipping, sparsely concentrated, and typically run in a direction parallel to the surrounding geologic formation.
- Any particular areas with possible substantial transmissivity results are likely discontinuous and unconnected.
- The potential for horizontal flow within the known individual fractures is definitive, however extremely inferred due to the unknown lateral dimension of the discovered fractured zones.
- Large-scale vertical permeability of the geologic formation is low.

Surface Water

Lake DERA (elevation approximately 2566 feet above MSL) is an approximately 12-acre man-made lake located along the northwest quarter of the property. The lake is fed by small creeks along its northwest corner, surface water runoff, and possibly by shallow groundwater flowing in from the north. Overflow from Lake DERA is channeled through an unnamed creek across the property and drains into the Little River approximately 3500 feet to the east-northeast. The Little River originates south of the Site and flows northward along the south and east property boundary. The river receives overflow from Lake Julia located southeast of the DuPont property and runoff from surrounding highlands from the south. The Little River continues its northern run for six miles where it drains into the French Broad River (Google Earth 2012).

3.0 FIELD INVESTIGATION ACTIVITIES

As previously stated, DuPont has been conducting soil and groundwater investigation and remediation activities at the Site for many years. Historically, these activities were conducted under the Site's HSWA CA permit. However, the most recent field investigation was conducted under the State's Risk Bill. In accordance with the requirements of the Risk Bill, this section describes the methodology that was used to complete the final field investigation activities. In addition, for completeness' sake, a summary of the methodology that was used in previous investigations is also included. Information about the CAMU groundwater monitoring activities that were conducted in conjunction with the final field investigation is presented in Section 6.0.

3.1 Historical Field Activities

3.1.1 Monitoring Well and Piezometer Installations

This section provides a description of the methods that were used to install the monitoring wells and piezometers that make up the current site ground water monitoring well network (Figure 3).

RFI Phase I Installations:

During the Phase I RFI, piezometers were installed utilizing DPT and augering methods. The piezometers were installed such that the top of the screened interval was placed 6 inches to 1 foot lower than the observed top of the saturated zone of the shallow aquifer to allow for groundwater fluctuations. In piezometer locations that probe refusal occurred (prior to reaching the saturated interval), solid stem auger drilling was used to advance the borehole and complete the well. Probe and auger locations that did not intercept the saturated zone before refusal were properly abandoned.

Piezometers were constructed of ¾-inch diameter, flush jointed schedule 40 PVC pipe. The 5-foot pre-packed screen was machine-slotted with 0.010-inch openings. A PVC riser was installed to approximately 2 feet above the ground surface. The pre-packed sand extended over the screen interval approximately 1 foot. A bentonite slurry was tremied into the remaining annular space to prevent surface runoff from entering the borehole.

The approved work plan for Stage II of the Phase I RFI proposed the installation of four additional piezometers and 12 monitoring wells. A total of 21 monitoring wells and no piezometers were completed during the Stage II field investigation.

A dynamic field approach was used to determine the target depths of the well screen intervals. The screen intervals of the nested well pairs were situated in the surficial aquifer based on the saturated thickness at each drilling location as determined by DPT and augering methods. One well screen interval bracketed the water table. The second, lower screen interval coincided with the bottom of the surficial aquifer. A 5-8 foot separation between the bottom of the well screen bracketing the water table and the top of the well screen located at/or near the bottom of the saturated zone was maintained. Well screen intervals bracketing the water table were 10 feet in length to account for water table fluctuations in all shallow monitoring wells except MW-114A due to waste materials being present. Well screen intervals that coincided with the bottom of the saturated zone were 5 feet in length in all deep monitoring wells except MW-102B, MW-111B; and MW-110B. When a saturated thickness of less than 15 feet was

encountered, a single monitoring well installed with a 10-foot screen bracketing the water table (MW-101, MW-105, and MW-108).

Well construction consisted of 2-inch PVC well casing with a mechanically slotted screen that was inserted into the auger. A sand pack was installed through the auger to approximately 0.5 to 2 feet above the top of the well screen. A bentonite slurry was placed on top of the sand pack. The remainder of the borehole was filled with a cement/bentonite slurry to ground surface. All wells have a concrete pad with a protective steel casing installed around the well casing. Bollards were installed as necessary to protect the well head.

RFI Phase II Installations:

Monitoring wells were installed using a track-mounted drilling rig equipped with 4.25 inch inner diameter (8.00-inch outer diameter) hollow stem augers. The total depth of the monitoring wells ranged from five feet to 68.5 feet below land surface (bls). Continuous soil samples were collected for lithologic description using direct push technology (DPT) prior to construction of the monitoring wells. Sample descriptions and monitoring well construction details were recorded in bound field logbooks by a geologist and summarized on boring logs provided.

Permanent monitoring wells were installed for the collection of groundwater samples as well as increasing the potentiometric database. In order to determine if a vertical gradient exists within the surficial aquifer and to effectively determine groundwater quality in areas where the saturated thickness of the surficial aquifer exceeds 15 feet, nested well pairs were anticipated to be constructed at several locations at the Site. A total of 17 nested well pairs were installed as well as one nested triplet.

A dynamic field approach was used to determine the target depths of the well screen intervals. The screen intervals of the nested well pairs were situated in the surficial aquifer based on the saturated thickness at each drilling location, using the same criteria as described above in the Phase I approach. In one instance where the saturated thickness of the surficial aquifer was greater than 60 feet, a third well monitoring well was installed (MW-211 A, B, and C).

Monitoring wells were constructed of 2-inch diameter, flush-jointed, schedule 40 polyvinyl chloride (PVC) casing and mechanically slotted with 0.010-inch opening (10 slot) screen, as described above in the Phase I approach.

Newly installed monitoring wells were developed over the course of the field investigation to remove sediments, repair damage to the formation, and ensure connectivity with formation. Development was achieved by lowering a submersible well pump to the bottom of the well and pumping the well until the purge water became clear. The length of the well screen was then surged with the pump or a surge block to free sediments from the sand pack and re-pumped until the absence of visual turbidity. The visual turbidity of the purge water determined the total number of times this process was repeated. In most cases, not more than 50 gallons total of development water was removed from the well. At least 24 hours were allowed between completion of the well and development activities. Upon development, wells were allowed to sit a minimum of 24 hours prior to initiating sample collection.

RFI Phase III Installations:

During the Phase III RFI activities, 16 groundwater monitoring wells were installed across the Site to provide sampling points where there were previous data gaps. Seven

of the monitoring wells were advanced into the bedrock and nine wells were advanced within the residuum.

The new bedrock wells were installed around the perimeter of the Site. Two were located north of SWMU 17, while BR-11 was installed southeast of SWMU 17. Monitoring well BR-4 was installed along the northeast boundary of the Site, while wells BR-1 through BR-3 were installed along Little River at the Site's south-southeastern boundary. Installing monitoring well BR-11 was the result of a field decision that was not part of the Work Plan or addendum and modification reports. A shallow well was originally planned for the location where BR-11 was installed. However, no groundwater was present in the residuum, and therefore it was necessary to install the well in bedrock.

All bedrock wells were advanced through zones of water-bearing fractures, ending at a point when the fractures were scarce, but not to exceed 100 feet bgs. The wells were installed using this criterion to capture the most water possible in the fractured bedrock. Surface casing were installed through the surficial aquifer and sealed in bedrock with Portland cement to prevent surficial contamination of the bedrock aquifer.

The bedrock monitoring wells were installed as Type III installations through the use of a track-mounted roto-sonic drilling rig utilizing dual rotary casing (outer conductor and inner core barrel) drilling techniques. This technology allowed for observation of lithologic conditions including fractures, joint sets, secondary mineralization, and foliation planes to aid in the determination of possible water-bearing zones within the granitic/gneiss rock formation.

Continuous soil samples were collected from ground surface to the top of bedrock during drilling operations for field screening, lithologic characterization, and description into a bound field book by a field geologist. Upon reaching the top of bedrock, a 4-inch threaded steel conductor casing was placed into the borehole through the outer conductor casing, and the annulus between the casing and the borehole was cemented in place using a neat cement grout while extracting the outer drill casing. The grout placed in the annulus between the borehole and the casing was allowed to cure for a minimum of 24 hours prior to advancing the borehole into the bedrock.

Bedrock coring activities were also completed using roto-sonic techniques through the permanent outer 4-inch steel conductor casing to a depth where sufficient fracture zones were encountered or a total depth of 100 feet below land surface was achieved. Rock cores were collected in most cases on 10-foot drilling intervals. Retrieved rock cores (approximately 4 inches in diameter) were extracted from the sonic core barrel; washed; evaluated for core recovery length, composition, fracture zones, and secondary water indicators; catalogued; and logged into a bound notebook by a field geologist. Each core box was labeled according to standard practices and stored at the facility for future use and correlation with the geophysical logs and subsequent evaluation.

Final Field Investigation:

No monitoring wells or piezometers were installed during the final field investigation.

3.1.2 GORE-SORBER® Sampling

As part of the Interim Phase III RFI Investigation activities (See *Interim Phase III RFI Report*, CRG 2008), a soil gas survey using GORE-SORBER® module technology was used to help further characterize SWMU 17 and downgradient areas. This technology utilizes an adsorbent engineered structure to collect a wide variety of volatile

compounds, which are evaluated with laboratory gas chromatograph (GC) / mass spectrometry (MS) methods. Results obtained from such surveys are useful in determining relative information with regard to the potential presence and spatial distribution of the volatile compounds.

Each module included a suitable granular adsorbent material that has the ability to absorb a broad range of volatile organic compounds (VOCs) and semi-volatile organic compounds (SVOCs). The sorbers have good hydrophobic properties and are sheathed in the bottom of a 4-foot long, vapor-permeable insertion and retrieval cord. Both the retrieval cord and the sorbent container are constructed of solely inert, hydrophobic, microporous GORE-TEX® ePTFE, similar to polytetrafluoroethene. The ePTFE acts as a protector from soil and groundwater without retarding vapor diffusion.

Using a pre-determined grid system, 45 GORE-SORBER® modules were installed September 6 through September 7, 2007, in 20 pilot holes completed to approximately 3 feet below ground surface. After a pilot hole was completed, the GORE-SORBER® module was removed from its reusable storage and shipping container and inserted into the pilot hole. The sorbers, which are at the end of the module, were pushed to the bottom of the pilot hole. The top of each module was fastened to a cork that was tamped flush with the ground surface to seal the annulus of the hole. Each location was flagged and properly marked for future location purposes.

The GORE-SORBER® modules were left in place for approximately 2 weeks. Upon retrieval from the pilot holes on September 21, 2007, the modules were resealed in shipping vials and placed into a shipping cooler on ice for transport to W.L. Gore & Associates of Elkin, Maryland for analysis of target constituents.

3.1.3 Vapor Intrusion Sampling

A vapor intrusion soil gas study was conducted in September 2008, by URS Corporation around the North Carolina State Forest property Visitor Center in response to chlorinated solvent contamination detected in January 2007 from the water supply well WSW-DSF3. DuPont followed up in the February 2008 *Interim Phase III RFI Report* with a conservative vapor intrusion analysis from the groundwater pathways that indicated trichloroethene did exceed indoor air screening levels. However, the NCDENR requested in May 2008 that a soil gas study be conducted.

As proposed in the *Notice of Modification Phase III RFI Work Plan* (DuPont CRG, 2008b), four soil gas samples were collected in SUMMA canisters from around the Visitor Center; one from each side of the building and a fifth sample of ambient air collected upwind of the building. Soil gas samples were collected at a depth of 5 feet below the depth of the basement slab as close to the building as practical. The intake of the ambient air sample was at approximately 3 to 5 feet off the ground (at the approximate midpoint of the building's ground-level story). Samples were analyzed for tetrachloroethylene (PCE); trichloroethene (TCE); 1,1-dichloroethene (1,1-DCE); cis-1,2-dichloroethene (cis-1,2-DCE); trans-1,2-dichloroethene (trans-1,2-DCE) and vinyl chloride. The URS *Phase III RFI Investigation Field Summary Report* (URS, 2009), which was included with the Phase III RFI report, contains detailed methodology and soil gas locations.

3.1.4 Historical Groundwater, Surface Water, and Soil Sampling

Various historical sampling events have been conducted across the Site from 1996 through the present. These events have included the sampling of various environmental

media including groundwater, surface water, and soil. Details and results of these sampling events are briefly summarized in Section 2.3 and are presented in detail in the documents listed in Section 2.3.1. The historical data were combined with the new data from the final remedial field investigation activities (summarized in the following section) and used to update the SCM (Section 7.0).

3.2 Final Remedial Field Investigation

Based on the overall site remediation goals and the SCM, the project team identified the remaining data gaps (as presented in the *Final Remedial Investigation Work Plan*) that needed to be addressed at the Site. The objectives of the final phase of field investigation were developed to fill the data gaps in order to support the completion of this *Remedial Investigation Report*. The following six objectives were addressed with the final field investigation:

1. Fill surface soil data gaps to support future proposed land uses (includes recreational and low-impact training use by the NCNG).
2. Complete confirmation soil sampling at SWMU 14 (the former ball field).
3. Ensure that adequate surface covers are present at SWMUs 4, 12, 13, 15, 16, 19, and 18/20.
4. Verify that groundwater concentrations are consistent with protection of sensitive surface waters.
5. Investigate current conditions in Lake DERA, DERA Creek, and Little River.
6. Verify SCM assumptions regarding absence of potential downgradient receptors of drinking water to support final risk evaluation.

This section presents details about the various field activities and tasks that were completed to address the data gaps and support the development of this report. The field activities were conducted in accordance with the procedures described in the Sampling and Analysis Plan (SAP), which was provided as Appendix A of the work plan. All investigation-derived waste was non-hazardous and was managed in accordance with the project-specific Waste Management Plan.

3.2.1 Site-Wide Surface Soil Sampling

To meet the state's current intended use of the property, it was critical to sufficiently understand the conditions in surface soil (defined by NCDENR in Figure 3 of their *Guidelines for Establishing Remediation Goals at RCRA Hazardous Waste Sites* as soil less than 2 feet bgs). Supplementary Site surface soil data were needed for evaluation purposes to ensure the protection of future intended users. As such, additional surface soil data were gathered during this investigation from within the former manufacturing area and other key locations (SWMUs 13, 14, 15, 16, and 19) as needed for use in the assessment of future exposure scenarios. Soil sample field observations are included as Appendix A.

Incremental Soil Sampling

Given the proposed use of the Site and to ensure that direct contact soil concentrations will be protective of potential future land use scenarios (i.e., military and recreational where potential receptors are forest rangers, NCNG personnel, utility workers, and adult or child trail users), the development of an accurate mean concentration of COPCs was

required. As soil is a highly heterogeneous solid with many components, sampling soil for the purpose of obtaining an estimate of the mean COPC concentration is highly susceptible to sampling errors from a variety of sources. Traditional sampling methods (e.g., discrete and composite sampling) do not adequately address this problem, especially when evaluating a large and potentially diffuse area without point sources (as in the case of this Site). In order to reduce these sampling errors, the project team used the Incremental Sampling Methodology (ISM) to assess the majority of the surface soil in the former manufacturing area. ISM is described in detail in a document published by the Interstate Technology & Regulatory Council entitled *Incremental Sampling Methodology* (February 2012). This document briefly describes ISM as

“...a structured composite sampling and processing protocol that reduces data variability and provides a reasonably unbiased estimate of mean contaminant concentrations in a volume of soil targeted for sampling. ISM provides representative samples of specific soil volumes defined as decision units (DUs) by collecting numerous increments of soil (typically 30–100 increments) that are combined, processed, and subsampled according to specific protocols.”

For the final field investigation, the former manufacturing area of the Site was divided into 11 DUs (Figure 7). With the exception of DU 1, the units were sized to result in approximately the same number of increments. Decision unit 1 covered an area that was mostly used for parking or office areas and was unlikely to show any evidence of site-related impacts; therefore, this DU was made larger. Ten of the units (DUs 1 through 10) were sampled using the ISM technique. In order to confirm previous surface soil detections and to meet other objectives, traditional soil sampling methods (discrete sampling) as described in the following section were used in DU 11 and the remaining SWMUs (SWMUs 13, 15, 16, and 19; Figure 8).

The ISM samples collected during the final field investigation were composed of increments collected from specific points throughout the DU. The positioning of the collection points was set using systematic random sampling. The initial grid cell sampling location was randomly determined and then subsequent increments were collected from the same relative location within each of the other grid cells. The incremental soil samples were prepared by collecting multiple increments of soil from the DU and physically combining these increments into a single sample. The sampling grid pattern that was used is shown in detail in the final investigation work plan.

The systematic random sampling approach was used to provide statistically defensible data and because it was relatively easy to implement. Decision unit 1 was divided into a 100-foot by 100-foot grid, while the remaining units were divided into 50-foot by 50-foot grids. Three replicate ISM samples made up of approximately 40 to 60 increments each were collected. A random location was pre-selected within the initial grid location and subsequent grids were sampled in the same relative location. Each of the replicates was sampled in a similar manner.

The site geographical information system (GIS) was utilized to randomly locate the three increment locations for the starting grid at each decision unit. Following the systematic random sampling technique, these locations were then replicated to each grid within the decision unit. No samples were collected under paved areas in any of the DUs. If an increment fell within a paved area or an obstruction was encountered preventing sample collection, the sampling team adjusted the increment slightly to move it off the paved area or other obstruction. The sample was collected as close to the designated sample

location as possible. The revised location of the increment was recorded. This adjustment did not impact the remaining increments collected at the DU.

Increments were collected from 6 to 18 inches bgs using a hand coring device. The diameter of the coring device was sized to provide the appropriate volume for each increment. Two separate cores were collected at each increment location. The first core was used to collect samples for non-volatiles organic compound (VOC) analysis, and the entire soil core was placed in the container for processing at the laboratory. The second core was used to collect samples for VOC and percent moisture analysis. The VOC soil core was subsampled by collecting several 5-gram plugs along the length of the core to be sampled. A Terra-Core® sampling device was used to collect 6 subsamples that were spaced approximately every 2-inches along the soil core. After the VOC sample was collected, the entire remaining volume of soil was collected in a separate container for percent moisture analysis. The ISM VOC approach was similar to that described for sampling ISM non-VOCs in the subsurface, except that numerous soil increments were placed directly into an adjusted volume of extraction solvent in the field (e.g., methanol).

An equal volume of soil was collected from each increment to ensure a representative sample. The incremental volume was calculated based on the total volume requested by the laboratory for each ISM sample using the procedures outlined in the ITRC guidance document.

The replicate ISM samples were collected in order to statistically evaluate sampling precision for each DU. The increments for these samples were collected separately from the initial sample and the samples were made of the same number of increments collected in the initial ISM sample. Three replicate samples (the initial ISM sample plus two additional samples) were collected, prepared, and analyzed in the same manner from each DU.

The samples were submitted for laboratory analysis of the constituents listed in Table 3. The non-VOC sample was air dried (if required), dry mixed, and sieved using a standard #10 sieve (<2 millimeters) to remove vegetation and larger particles following the procedures outlined in the ITRC guidance document.

Discrete Surface Soil Sampling

As described in the Final Investigation Work Plan, discrete surface soil samples were collected in DU 11 around AOC A and at the remaining SWMUs (SWMUs 13, 14, 15, 16, and 19). Surface soil samples in these areas were collected with a hand coring device (e.g., hand auger) from the 6 to 18 inches bgs interval at the approximate discrete locations shown on Figure 8. The samples were submitted for laboratory analysis of the constituents listed in Table 3.

The surface soil samples to be analyzed for VOCs were collected directly from the sample collection device with a small coring tool (a Terra-Core® sampling device) and then capped and/or preserved as appropriate. For all additional parameters, soil from the depth interval to be sampled was transferred from the collection device to a stainless steel mixing bowl for homogenization. The homogenized sample was then transferred to the appropriate laboratory-supplied sample collection bottles using decontaminated stainless steel spoons or trowels. A separate aliquot of each sample was placed in a re-sealable plastic bag and field screened for VOCs/SVOCs with a Photo Ionization Detector. All non-disposable sampling equipment was decontaminated between sample depths and borehole locations using the procedures outlined in the work plan.

SWMU 14 Soil Sampling

As described above in Section 2.5.2, the former ball field area (now SWMU 14) was reclaimed and used as a ball field during DuPont ownership but has not been used since DuPont reacquired the Site. A PET recycling project was completed at SWMU 14 in July 2012. Activities consisted of excavating PET for recycling and moving any unusable nonhazardous waste from SWMU 14 to the CAMU established at SWMU 11. The details of the proposed interim SWMU 14 remediation/recycling project were outlined in the revised *Interim Measures Work Plan* (WRSScompass 2011).

Only a minimal amount of “unacceptable” material was encountered during the remediation of SWMU 14. Unacceptable material was defined as material that had to be transported off-site for proper disposal instead of being transferred to the CAMU. These materials included stained soils or liquids, metal containers (e.g., drums and cylinders), and other wastes (e.g., tires). The unacceptable material that was excavated from SWMU 14 included a truck tire (which was picked up for recycling), a corrugated metal pipe, a five gallon bucket of Thermon Heat Transfer Cement mastic later identified through the manufacturer’s material safety data sheet as nonhazardous material, three open-top drum carcasses containing PET and residual glycol that was solidified with concrete, and a gas cylinder transported for analysis and proper disposal. All of these materials were determined to be nonhazardous. A small amount of greenish-blue water that evaporated within a day was also noted in the excavation. The location in which each item was discovered was noted on a topographic drawing. The findings of the IM activities are presented in the *Interim Measures Report* that was submitted to NCDENR on October 26, 2012 (Parsons 2012c).

The IM work plan called for post-excavation confirmatory soil samples to be collected from the bottom of the SWMU 14 excavation in a manner intended to document environmental conditions as they exist following excavation. Due to the expansion of the excavated area and issues with excess water present in the excavation, DuPont decided to postpone the collection of confirmatory samples and combine them with future investigation activities at the Site. Therefore, the post-excavation soil sampling of SWMU 14 was conducted as part of this final field investigation.

The final investigation confirmatory soil sampling plan for SWMU 14 was developed to ensure that samples were collected from the areas where “unacceptable” material was uncovered and to meet the Site objectives for future intended use. As part of the final field investigation, 10 surface soil samples were collected from the 6 to 18 inches bgs interval at the locations shown on Figure 8. One confirmatory sample was collected from each of the five areas where “unacceptable” material was encountered, and five additional samples were collected from the interior of the excavation where no unacceptable material was uncovered. The soil samples were collected in accordance with the procedures described in the work plan and in the Discrete Surface Soil Sampling section above. All samples were submitted to a NC-certified laboratory for analysis of the area-specific parameters listed in Table 3.

Additional Soil Sampling

In order to address specific questions regarding historical subsurface soil samples collected from SWMU 2C and SWMU 15, additional discrete subsurface samples were collected from these SWMUs during the final investigation. The soil samples were collected in accordance with the procedures described in the work plan and in the Discrete Surface Soil Sampling section above.

Surface Cover Investigation

To meet the state's current intended use of the property, it was necessary to further investigate existing Site conditions to ensure that adequate surface covers are present at SWMUs 4, 12, 13, 15, 16, 19, and 18/20. The observations will be used, in part, to support the development of a *Soil Use/Excavation Management Plan* as part of the final Site remedial approach.

The existing cover material was investigated by collecting several soil cores from SWMUs 4, 12, 13, 15, 16, 19, and 18/20 to determine the thickness and condition of the cover. The cores from SWMUs 13, 15, 16, and 19 were collected at the same locations as the borings where the discrete surface soil samples were collected (Figure 8). The approximate locations of the surface cover investigation cores collected from SWMUs 4, 12, 18, and 20 are also shown on Figure 8.

A small diameter coring device was used to collect soil cores that were at least 24 inches long. The cores were then inspected to determine if the cover material extended to this depth, and the physical description of each was recorded. In addition, historical boring logs of each area (where available) were reviewed and used to assist in the cover investigation.

3.2.2 Groundwater Investigation

During the final field investigation, a selection of the Site's monitoring wells and WSWs were sampled to verify current site-wide groundwater conditions. The wells that were sampled during this event are listed in Table 4 and are shown on Figure 9. The sampling plan was developed to meet the following requirements:

- Re-sample all of the WSWs
- Re-sample the monitoring wells downgradient of key areas/SWMUs and/or near surface waters
- Re-sample all of the bedrock monitoring wells
- Re-sample wells that have limited historical analytical data
- Confirm understanding of current Site groundwater conditions

Prior to initiation of groundwater sampling activities, static water level measurements were collected from the wells and piezometers in the Site's well network (Figure 3) to provide an updated data set from which to analyze current groundwater flow conditions. Groundwater samples were then collected from the locations shown on Figure 9 using the procedures described in the SAP (Appendix A of the work plan). Groundwater samples were obtained using low-flow groundwater sampling techniques in accordance with the USEPA Region IV Groundwater Sampling Operating Procedure (dated March 6, 2013) for collection of groundwater samples.

Low-flow sampling techniques were used to purge the monitoring wells and for collection of all groundwater samples. Purging was conducted to introduce non-stagnant water to the wells from the surrounding aquifer. Low-flow groundwater sampling techniques are used to obtain the most representative groundwater sample possible and to minimize volatilization, waste generation, and potential exposure to impacted purge water. Field parameters were recorded in each well during purging until stabilization was achieved. Field parameter stabilization was defined as measurements being within a 10% range over a five-minute interval. When these field parameters became consistent relative to

previous readings, the well was considered to contain a sample representative of current groundwater conditions. Final field parameter readings are included in Table 5.

The analytical laboratory supplied all necessary sample containers with appropriate preservatives along with shipping containers. All samples were submitted to a NC-certified laboratory for analysis of the area-specific parameters listed in Table 4.

3.2.3 Surface Water, Sediment, and Pore Water Investigation

In order to sufficiently understand the current Site surface water and sediment conditions, additional samples were collected to confirm the historical sampling results. In addition, supplementary surface water and sediment samples were collected to fill remaining data gaps. Pore water samples were also collected from some locations to increase understanding of the connection between Site groundwater and the adjoining surface water bodies.

Surface water, sediment, and/or pore water samples were collected from the locations shown on Figure 10. Four surface water samples were collected from Little River at locations previously sampled. Nine surface water samples were collected from Lake DERA, and three were collected from the DERA Creek tributary. Surface water samples were also collected from the runoff from SWMU 14 (ball field sample) and two locations that drain into Little River. Sediment was collected from all of these locations except for the location in the DERA Creek tributary immediately adjacent to Lake DERA (location of SW-8). A total of 19 locations were sampled for surface water, and 18 locations were sampled for sediment. Pore water was sampled at 11 of these locations (see Figure 10).

All samples were submitted to a NC-certified laboratory for analysis of the area-specific parameters listed in Table 3. Additional details about the specific surface water, sediment, and pore water sampling methods to be used in the investigation are included in the SAP. Field parameter readings are included in Table 5.

Sampling began at the most downstream location and moved upstream to minimize cross contamination between sample locations. In addition, wherever sediment and surface water samples were collected together, field personnel collected surface water grabs prior to the corresponding sediment samples to minimize sediment disturbance. Wading was the preferred method for reaching each sampling location, particularly if the stream had a noticeable current (i.e., is not impounded). However, if the stream/lake sample location was too deep to wade (>4 feet deep), the sample was collected from a boat.

Surface Water Sampling Methodology

Surface water samples were sampled in accordance with the USEPA Region IV Surface Water Sampling Operating Procedure (dated February 28, 2013) for collection of surface water samples. The samples were collected with a peristaltic pump attached to tubing secured to a pole or other weight. The pole with attached tubing was lowered to the desired sampling depth beneath the water surface. The surface water samples were pumped directly into the appropriate laboratory-supplied sample containers. When entering the stream, Parsons field personnel approached the water sampling location from downstream so as not to increase the turbidity in the water sample during collection.

During the final Investigation, if the water depth at the sampling point was less than 0.5 meter (m), the samples were collected at a depth equal to one-third of the water depth measured from the water surface. If the water depth was greater than 0.5 m, the

samples were collected at a depth of 0.3 m below the surface. All samples collected for dissolved metals analyses were filtered through a 0.45 micron filter attached to the peristaltic pump to remove additional suspended particulates from the sample and subsequently placed in a laboratory-supplied sample bottle. All tubing and filter devices were dedicated single-use equipment to eliminate cross-contamination.

Sediment Sampling Methodology

Sediment samples were collected with a stainless steel Ponar, Eckman, or Peterson dredge (or equivalent sampling device). Prior to collection at each sample location, the dredge and any additional sampling equipment (e.g., stainless steel spoon, polyethylene or stainless steel tray) were rinsed with de-ionized or distilled water, then ambient water. Samples were collected and deposited into a stainless steel bucket. A minimum of three grab samples were composited using only the top 5 centimeters of sediment, mixed thoroughly with a clean stainless steel spoon, and deposited into a laboratory-supplied sample container.

Creek/river grab samples were collected from the middle and from a third of the distance from each of the banks of the stream and composited. Grab samples from the lake were collected at three different locations separated by a distance of approximately two feet from the lake bottom and composited.

Pore Water Sampling Methodology

Sediment pore water was collected using a PushPoint™-type sampler. A PushPoint™ sampler typically consists of a pointed tubular stainless steel tube with a screened zone at one end and a sampling port at the other. The pointed end with the screened zone consists of a series of very fine interlaced machined slots to allow pore water to enter the sampler. A removable guard rod adds rigidity to the sampler during sediment insertion. Pore water was collected through the opposite end of the device by connecting flexible tubing and using a syringe or peristaltic pump to extract the sample. The PushPoint™ sampler was cleaned after each use by rinsing with de-ionized or distilled water. Equipment cleaning took place after each sample was collected. All tubing was dedicated, single-use equipment to eliminate cross-contamination.

3.2.4 Field Quality Assurance/Quality Control Sampling

Field quality assurance/quality control (QA/QC) samples were collected as part of the sampling program. The purpose of the QA/QC Program was to ensure that collected data were both representative and valid. Data Quality Objectives (DQOs) enable the decision-maker to assess the level of certainty that can be attributed to environmental measurements. The DQOs consist of comparability, accuracy, precision, completeness, and representativeness.

To ensure that the DQO for comparability was satisfied, all sampling activities followed the standard operating procedures described in the SAP. Each sample was documented at the time of collection by the investigator. The sample quantity, type, and location were recorded in the field logbook. Sample containers were labeled with sample identification numbers, requested laboratory analyses, and sample preservative type, if present. Prior to dispatch of the samples, chain-of-custody forms were completed and the sample-shipping cooler was secured with a custody seal.

The quality and integrity of samples collected and analyzed during the investigation were monitored by routine preparation of various QA/QC samples in the field. Field program QA/QC samples included trip blanks, duplicates, and equipment/rinsate blanks:

- Trip Blanks – Trip blanks satisfy the DQO of accuracy and consist of cleaned sample vials containing analyte-free water that have been pre-certified by analysis at the laboratory. Trip blanks accompanied every shipping cooler containing sample bottles specified for VOC analysis to determine if cross-contamination occurred during shipping.
- Duplicates – Field duplicate samples were collected to ensure precision and comparability of results and were collected in the same manner as the associated analytical samples. By comparing the results of the duplicate and the original sample, the precision of the analytical method, sample matrix and collection technique could be evaluated.
- Equipment Blanks – Equipment blanks were collected during the field activities to address the DQOs of accuracy and representativeness and were used to identify potential sources of cross-contamination. At the sample location, analyte-free water or deionized water was poured over or through the sample collection device, collected in a sample container, and preserved as appropriate. All blanks were handled, transported, and analyzed in the same manner as the actual field samples.

The quality and integrity of samples analyzed during the investigation were also monitored by routine analysis of various QA/QC samples in the laboratory. The laboratory prepared and analyzed the QA/QC samples specified in the analytical methods and according to their in-house Standard Operating Procedures (SOPs). Laboratory QA/QC samples included Matrix Spike/Matrix Spike Duplicate (MS/MSD) samples and method blanks:

- MS/MSD – MS/MSD samples were analyzed by the laboratory to ensure the DQO of precision was met. MS/MSD samples were spiked with a known concentration of target analyte(s) to determine if bias existed in a given analytical method.
- Method Blanks – Method blanks satisfy the DQO of accuracy, and were used to document contamination resulting from the analytical process. In the laboratory, analyte-free water or deionized water was carried through the complete sample preparation and analytical procedure.

The methods and procedures for monitoring the laboratories' QA/QC programs are documented in the laboratory QA Plans, which are available for review upon request.

The results of the QA/QC samples are included with the laboratory analytical data in Appendix B. The electronic data submitted for this project was reviewed via the automated DuPont Data Review (DDR) process. The DDR is an automated internal review process used by DuPont to assist with the determination of data usability. Overall, the project data are acceptable for use as reported by the laboratory.

3.2.5 Verification of Downgradient Drinking Water Receptors

As part of the final field event, the project team investigated the surrounding area to determine if there are currently any potential drinking water receptors downgradient of the Site. This effort was used to support the final human health risk evaluation (as presented in Section 7.0) and to confirm that Site conditions remain fully protective of the future intended use and people.

To help identify potential drinking water receptors in the vicinity of the Site, available on-line well records were reviewed. In addition, the project team worked with DSRF personnel to identify wells on the DSRF property within the vicinity of the Site. Six additional wells (excluding the WSW at the DSRF Visitors' Center) were identified on the DSRF property. These wells are shown on Figure 11.

This page intentionally left blank

4.0 DATA EVALUATION

Because the remaining remedial activities are being conducted under the Risk Bill, site-specific RLs were calculated and have been used to evaluate historical and recently-collected environmental analytical data in order to provide information to support future remedial-decision making. Consistent with the NCDENR document entitled “Establishing Remediation Goals for the DuPont Brevard Facility,” dated February 27, 2014, site-specific RLs for soil and groundwater were developed for the protection of human health and the environment based on planned future uses as proposed by the DSRF and the NCNG. In developing the site-specific RLs, receptors and routes of exposure were refined based on the currently proposed uses. Constituents of potential concern (COPCs) were identified based on comparison of existing RFI data against screening levels for appropriate media and exposure pathways. This section describes the steps of the data evaluation approach, and the results are presented in Tables 6 through 29.

4.1 Confirmation/Identification of COPCs

The newly-collected data from the final investigation was screened in the same/similar manner as was used to develop the site-specific RLs. The purpose of this screening step was to confirm relevant COPCs in soil and groundwater and to potentially identify relevant COPCs in surface water and sediments. The screening process for each media is described below.

4.1.1 Soil

Soil concentrations were compared to NC DENR Inactive Hazardous Site Branch (IHSB) Preliminary Soil Remediation Goals (PSRGs) for unrestricted land use. The PSRGs represents a combined exposure including inhalation of particulates and volatile compounds, dermal absorption, and ingestion. The PSRGs are based on a cancer risk of 1×10^{-6} and a HQ of 0.2 (for non-carcinogens). Soil concentrations were compared to PSRGs for protection of migration to groundwater. In addition, soil concentrations for inorganics were compared to site-specific background concentrations determined during the RFI (Parsons, 2012a).

4.1.2 Groundwater

Constituents detected in groundwater were compared to North Carolina groundwater standards established in 15A NCAC⁴ 2L .0200 (NC2L standards) or NC Interim Maximum Allowable Concentrations.

4.1.3 Surface Water

Surface water concentrations in Little River, Lake DERA and DERA Creek were compared to the 15A NCAC 2B (NC2B standards) for protection of freshwater organisms (chronic), protection of trout waters and protection of human health (organism only). Where NC2B standards are not available, National Recommended Water Quality Criteria (USEPA 2012) were used. For constituents that do not have criteria established in the aforementioned sources, surface water screening values were used from alternate sources consistent with 15A NCAC 02B.0208. Pore water concentrations were also compared to NC 2B standards for protection of aquatic life (chronic).

⁴ NCAC – North Carolina Administrative Code

4.1.4 Sediment

Sediment concentrations were compared to PSRGs for unrestricted land use. This is considered a very conservative screening for sediment because exposure to sediment would be less frequent than the assumptions used in the development of the PSRGs.

The results of sediment chemistry analyses were compared to sediment quality benchmarks (SQBs) to evaluate the potential for adverse effects to benthic macroinvertebrate communities resulting from exposure to sediment-associated constituents. Consistent with NC DFW guidance, sediment analytical results were initially compared to USEPA Region 4 sediment screening values (<http://www.epa.gov/region4/superfund/programs/riskassess/ecolbul.html>). If a sediment screening value was not available from USEPA Region 4, SQBs was obtained from literature-based sources, including but not limited to

- Consensus-based threshold effects concentrations (TECs) and probable effects concentrations (PECs) developed by MacDonald et al. (2000)
- Lowest effects level (LEL) and severe effects level (SEL) developed by Persaud et al. (1992)
- USEPA Region 5 Ecological Screening Benchmarks (USEPA, 2003)
- Canadian Interim Sediment Quality Guidelines (ISQG) and Probable Effects Level (PEL) as developed by CCME (2013)
- Risk Assessment Information System (RAIS; <http://rais.ornl.gov/>)

Additional sources of sediment quality benchmarks from federal and state agencies, as well as literature studies were consulted as needed to identify benchmarks for comparisons with bulk sediment results.

4.2 Development of Site-Specific RLs

Consistent with the NCDENR document entitled “Establishing Remediation Goals for the DuPont Brevard Facility,” dated February 27, 2014, site-specific RLs for soil and groundwater were developed for the protection of human health and the environment based on planned future uses as proposed by the DSRF and the NCNG. In developing the site-specific RLs, receptors and routes of exposure were refined based on the currently proposed uses. As detailed above, COPCs were identified based on comparison of existing RFI data against screening levels for appropriate media and exposure pathways. As a result, RLs were developed for the following:

- Groundwater concentrations protective of receptors in Little River (human and ecological)
- Soil concentrations protective of potential groundwater receptors (Little River)
- Direct contact soil concentrations protective of potential future land use scenarios, i.e., military and recreational.

Consistent with Section § 130A-310.68 (b)(9) of House Bill 45 (the Risk Bill), direct contact soil RLs were derived using the range of acceptable target cancer risk levels (10^{-6} to 10^{-4}) and a target hazard quotient of 1.

The technical approach and calculations used to develop the RLs were detailed in a separate document which was submitted to NCDENR in December 2014 and which has been included as Appendix C.

5.0 FINAL FIELD INVESTIGATION RESULTS DISCUSSION

This section provides a summary of the results of the data evaluation conducted on the final field investigation results. Further discussion of the results is presented in Section 7.

5.1 Soil

The results of the final investigation soil sampling are presented in Tables 6 and 7 and are shown on Figures 12 and 13. Overall, the constituents that were detected in surface soil are consistent with prior RFI sampling results. Concentrations in the surface soils are within the range of RLs for the designated proposed future uses.

5.1.1 Incremental Sampling Methodology Soil Results

The Interstate Technology Regulatory Council (ITRC) guidance document for the Incremental sampling methodology (ISM) provides several options for making decisions based on the results of ISM sampling data. Similar to data collected via discrete sampling, there is no one decision mechanism dictated by the use of ISM sampling. The guidance provides seven possible decision mechanisms; each has its own applications, strengths, weaknesses, and assumptions (ITRC 2012).

For the ISM data collected at the Brevard site, the selected decision mechanism is comparison of the 95% Upper Confidence Level (UCL) on the mean of the replicate data from the DU to the action levels. The purpose of the ISM sampling at the Site is to determine if any constituents present in the soil around the former manufacturing area pose a risk to human health or the environment based on the proposed future use. Therefore, the estimate of the mean concentration provided by ISM sampling must be health protective, meaning that there is low chance of underestimating the actual mean concentration within the DU. Using the 95% UCL will accomplish this goal.

There are some important differences with 95% UCLs from ISM data versus discrete sample data. Calculation of a 95% UCL for ISM data requires a minimum of three ISM samples (fewer than is required for discrete data sets to yield reliable 95% UCL values). Also, with discrete data sets, the maximum concentration observed is often used as the exposure point concentration (EPC) if it is less than the calculated 95% UCL. When using ISM data, the calculated 95% UCL value is always used as the EPC even if it is higher than any of the individual ISM results. Due to the fewer number of replicates, calculation of the 95% UCL cannot be accomplished using the same methods utilized for discrete samples. Two methods for calculating the 95% UCL from ISM data are available in the ITRC guidance: Student's-t and Chebyshev.

The Student's-t UCL is calculated using the formula below:

$$UCL = \bar{X} + t_{(1-\alpha/2), n-1} \times \frac{S_X}{\sqrt{r}}$$

Where

\bar{X} = arithmetic mean of all samples

S_X = standard deviation of all ISM samples

r = number of ISM samples

$t =$
 $(1 - \alpha)^{\text{th}}$ quantile of the Student's t distribution with $(r - 1)$ degrees of freedom.

$(1 - \alpha) =$ the probability associated with the Student's t distribution = 0.1

The Chebyshev UCL is calculated using the formula below:

$$UCL = \bar{X} + \left(\sqrt{\frac{1}{\alpha} - 1} \right) \times \frac{S_g}{\sqrt{r}}$$

Where

\bar{X} = arithmetic mean of all samples

S_g = standard deviation of all ISM samples

r = number of ISM samples

$\alpha = 0.05$

The choice of method depends on several factors including the known or anticipated variability or error. The Chebyshev method always produces an equal or higher 95% UCL than the Student's-t method for a given set of ISM data (as long as the number of replicates is greater than 2). However, it also tends to have a higher relative percent difference (RPD) (ITRC 2012).

Based on simulations conducted by ITRC, the coverage (e.g. that the calculated UCL meets or exceeds the actual mean) provided by the two UCL calculation methods depends upon the degree of variance (or dispersion) of the contaminant distribution within the DU. Although a variety of statistics provide a measure of dispersion, the most commonly utilized value for evaluating which method is appropriate for calculating the UCL of ISM samples is the coefficient of variation (CV). The coefficient of variation is the standard deviation (SD) normalized by the mean and is appropriate for normal distributions. The ITRC research determined that the Student's-t value provided good coverage for CV's less than 1.5; while the Chebyshev result provided good coverage when the CV was equal to or greater than 1.5. Note that in order to obtain a proper estimate of the error; the CV must reflect the SD of the increments (aka SD of the DU) divided by the mean, not the SD of the replicates divided by the mean. Since the individual increments are not typically kept for individual analysis, there is no direct measure of the CV (ITRC 2012).

The SD for the increments can be estimated by multiplying the SD for the replicates by the square root of the total number of increments within each replicate. The CV calculated using this SD can then be utilized to evaluate which UCL is most appropriate. An excel spreadsheet was used to calculate the 95% UCL, the CV, and various other statistics for each constituent detected at least once at each decision unit. The calculations are presented in Appendix D. For constituents that were not detected in one or two of the samples, a value of one-half the detection limit was used to calculate the 95% UCL.

The resulting 95% UCL was then compared to the NCDENR Inactive Hazardous Sites Branch (IHSB) Preliminary Soil Remediation Goals (PSRGs) for direct contact based on residential and industrial exposures. A summary of the results is presented in Table 7 and discussed further in Section 7.

5.1.2 Surface Cover Investigation

The project team investigated existing Site conditions as part of the final field event to ensure that adequate surface covers are present at SWMUs 4, 12, 13, 14, 15, 16, 19, and 18/20. Soil cores collected from SWMU 4, SWMU 13, SWMU 14, SWMU 16, SWMU 19, and SWMU 20 indicated that a two-foot soil cover was intact. However, historical soil borings collected during the Phase II RFI indicated that the soil cover was insufficient in portions of the following above-mentioned SWMUs: SWMU 13, SWMU 16 and SWMU 19 (See Phase II RFI, CRG 2005).

One soil core collected during the final investigation from SWMU 12B contained green turquoise plastic. During the final investigation, some plastics, high purity silicone fragments, and other material were identified in SWMU 15. In SWMU 18, various types of construction debris were observed. Field descriptions from the surface cover investigation are included in Appendix A.

5.2 Groundwater

The results of the final investigation groundwater sampling are presented in Tables 12 through 14 and are shown on Figure 14. The newly-collected groundwater data confirms that Site conditions are fully protective of the current and future intended use and the environment. Overall, the constituents detected in groundwater are mostly consistent with previous RFI phases. Chlorinated VOCs (VC, PCE, TCE) and metals (Fe, Mn) most frequently exceeded NC 2Ls. Consistent with prior findings, groundwater data does not indicate the potential for groundwater to discharge to surface water bodies above NC 2B standards. Further discussion of the site groundwater results is presented in Section 7.

5.3 Surface Water

The results of the final investigation surface water sampling are presented in Tables 17 through 19 and are shown on Figure 15. The results show that there were no exceedances of NC 2B standards (human health or aquatic life) or Ecological Screening Values (ESVs) in Little River or Lake DERA.

Iron exceeded the NC 2B standard (aquatic life) in one location (SW-8) in DERA Creek. However, no exceedances were observed in locations sampled further downstream prior to confluence with Little River. Manganese also exceeded the ESV in all locations in DERA Creek. Iron also exceeded the NC 2B standard (aquatic life) in the SWMU 14 drainage ditch (ball field sample). In the seep location (MW-26), vinyl chloride and iron exceeded the NC 2B, and manganese exceeded the ESV.

The data confirms that there is limited potential for adverse ecological effects from Site surface water. There were limited detection of VOCs and SVOCs (none at concentrations exceeding ESVs). In addition, there were only limited exceedances of ESVs for iron and manganese, which have typically limited bioavailability and background contributions. Further discussion of the surface water results is presented in Section 7.

5.4 Sediment

The results of the final investigation sediment sampling are presented in Tables 21 through 23 and are shown on Figure 15. Overall, the results indicate limited potential adverse ecological effects from Site sediment. There were no exceedances of the ESVs in Little River. The ESVs were only exceeded in a few locations:

- Lake DERA (for PAHs at only one location, SED-28)
- DERA Creek (for manganese at SED-09 and SED-10 and PAHs at SED-09)
- Seep (SED-26) for metals (iron, manganese, silver, and tin) and VOCs (1,1-dichloroethane and carbon disulfide)

In addition, there is limited potential for risk to human health. Further discussion of the sediment results is presented in Section 7.

5.5 Pore Water

The results of the final investigation pore water sampling are presented in Table 20. As shown in the table, none of the constituents were detected at concentrations exceeding ESVs. In addition, no SWMU-related constituents were detected in Lake DERA pore water, which supports the SCM that Lake DERA does not receive groundwater discharge.

5.6 Receptor Well Survey

A water supply well search within the vicinity of the DuPont property was conducted to identify potential groundwater receptors. Data from the National Well Inventory System was reviewed (<http://nwis.aterdata.usgs.gov/nc/nwis/inventory?search>), along with existing water supply well data of wells currently on the Site property. In addition, the existing WSWs located on the neighboring DSRF property were visually inspected by the sampling team in the field. Results of the data base search and well head survey identified five WSWs on the DuPont property and seven on the DSRF property to the south of the Site (except for the well at the DSRF Visitors' Center, which is located to the northwest). The site WSWs are shown on Figure 3 and the DSRF wells are shown on Figure 11.

Of the five water supply wells on the Site, only one is currently in use for providing potable (but not drinking) water. The remaining four wells are inactive and locked, but not abandoned. One of the seven water supply wells found on the DSRF property is located at the DSRF Visitors' Center. This well has an installed GAC system (see Section 2.5.1) and is the focus of a routine semi-annual groundwater sampling program. Six of the water supply wells found on the DSRF are located to the south of the Site property (not in the direction of groundwater flow) and are separated from the Site by the Little River. Of these six wells, four are currently in use for potable water. Due to their positions relative to the Site property and being separated from the Site by the Little River, none of these wells are thought to be interconnected with on-site water regimes.

6.0 CAMU SAMPLING

As described above in Section 2.5.2, a CAMU has been established at SWMU 11. Interim closure of the CAMU was completed in July 2012, and an interim CAMU groundwater monitoring program is being implemented to provide a means to monitor the surrounding groundwater from the time of the initial use of the CAMU until the final remedial decision-making for the CAMU/SWMU 11 is completed.

The Interim CAMU Groundwater Monitoring Plan (GMP; August 2010) established the groundwater monitoring program to function as a temporary safeguard for protecting human health and the environment during the implementation of the CAMU. After the CAMU goes through final closure, appropriate long-term monitoring needs for the CAMU will be evaluated and incorporated into the overall long-term strategy of the Site. This strategy will replace the interim CAMU groundwater monitoring program.

The currently-established interim CAMU groundwater monitoring program includes the semi-annual collection of groundwater samples from two monitoring wells located hydraulically upgradient of the SWMU 11 CAMU (shallow monitoring well MW-216A and top-of-bedrock monitoring well MW-216B), and from seven wells located cross-gradient and downgradient of the SWMU 11 CAMU (shallow wells MW-106A, MW-107A, R87-S8, R87-S9, and R87-S10; and top-of-bedrock wells MW-107B and MW-213). The program also includes semi-annual sampling of two surface water locations along Little River (one upgradient and one downgradient of the SWMU 11 CAMU) and the submittal of two semi-annual reports per year summarizing the results of the sampling activities.

Historical Site data is used as a baseline for comparison purposes. New data collected during the interim CAMU groundwater sampling events are compared to historical results and to applicable groundwater standards to determine whether the placement of RWM in the SWMU 11 CAMU is impacting the surrounding groundwater quality. The first semi-annual sampling event was conducted in the second half of 2012 following the interim closure of the CAMU, and semi-annual groundwater monitoring has been ongoing. The 2H14 CAMU sampling was conducted in conjunction with the final field investigation activities at the Site.

This section of the report has been prepared in lieu of a separate 2H14 CAMU groundwater monitoring report. It summarizes the results of the 2H14 semi-annual interim CAMU groundwater sampling event that was conducted in October/November 2014. The sampling activities summarized in this section were conducted in accordance with the procedures described in the Interim CAMU GMP.

6.1.1 CAMU Project Objectives

The overall objectives of the Brevard CAMU interim groundwater monitoring program (as established in the Interim CAMU GMP) are to

- Confirm RWM placed into the CAMU does not adversely impact human health and the environment and
- Ensure compliance with CAMU interim post-closure monitoring requirements.

To meet these objectives, collected data are compared to baseline conditions previously established in the GMP and to applicable NC groundwater protection standards to gauge whether the addition of RWM into the SWMU 11 CAMU is impacting the quality of the surrounding groundwater.

6.1.2 CAMU Field Activities

The 2H2014 interim CAMU field activities were conducted at the Site in October and November 2014 in accordance with the procedures described in the Interim CAMU GMP. Additional details are provided below.

Sampling Activities

The following sampling activities were conducted as part of the 2H2014 event:

- Collection of static water levels from the nine wells in the CAMU monitoring well network (in conjunction with collecting water levels from the remaining wells in the site monitoring well network);
- Collection and laboratory analysis of groundwater samples from the nine wells in the CAMU monitoring well network; and
- Collection and analysis of surface water samples from two locations along Little River in the vicinity of the SWMU 11 CAMU.

Prior to the start of groundwater sampling, static groundwater levels were measured in the nine existing wells in the CAMU monitoring well network (see Figure 16 for well locations) using a decontaminated electronic water level indicator. The recorded water levels (listed in Table 2) were used to develop an updated groundwater potentiometric surface map for the CAMU (Figure 16).

Groundwater samples were then collected from the two monitoring wells located hydraulically upgradient from SWMU 11, and from the seven cross-gradient and downgradient (relative to SWMU 11) wells.

Low-flow sampling techniques were used to purge the monitoring wells and for collection of all groundwater samples. Purging was conducted to introduce non-stagnant water to the wells from the surrounding aquifer. Low-flow groundwater sampling techniques are used to obtain the most representative groundwater sample possible and to minimize volatilization, waste generation, and potential exposure to impacted purge water. Field parameters were recorded in each well during purging until stabilization was achieved. Field parameter stabilization was defined as measurements being within a 10% range over a five-minute interval. When these field parameters became consistent relative to previous readings, the well was considered to contain a sample representative of current groundwater conditions. Final field parameter readings are included in Table 5.

Surface water samples were collected from two locations in Little River; one upgradient (SW-6) and one downgradient (SW-5) of the CAMU (Figure 10). The surface water field parameter readings are also included in Table 5.

The target analytes of this investigation were specified in the GMP. All groundwater and surface water samples were submitted to the laboratory for analysis of the following target analytes:

- Appendix I VOCs by USEPA Method SW-846 8260B
- SVOCs, 1,1 biphenyl, diphenyl ether, and 1,4-dioxane by USEPA Method SW-846 8270D
- Appendix I metals by USEPA Method SW-846 6010B/6020/7470A
- Glycols by USEPA Method SW-846 8015B

As requested by NCDENR on July 21, 2010, 2,5-dimethylfuran (library search), phenol, 1-methylnaphthalene, 2-methylnaphthalene, naphthalene, 1,2-diphenylhydrazine, dibenzofuran and polynuclear aromatic hydrocarbons (PAHs) were added to the list of SVOCs for analysis.

CAMU Groundwater Elevations

On November 3, 2014, static water level measurements were recorded from the nine on-site monitoring points (Table 2) and used to create an updated potentiometric surface map of the shallow aquifer (Figure 16) in the vicinity of the SWMU 11 CAMU. The potentiometric surface depicted in Figure 16 has a two-part flow pattern. Groundwater flows from west to east until approximately half way through the CAMU, where it shifts to a gentler gradient northeast and eventually to the north. The eastern flowing groundwater has a gradient of approximately 0.01 foot per foot, while the northeastern and northern flowing groundwater gradient is approximately 0.008 foot per foot. Groundwater flow conditions recorded during the 2H14 event are consistent with historical observations in this area of the Site.

6.2 CAMU Sampling Results

The following subsections present the results of the 2H2014 CAMU groundwater sampling event. The CAMU sampling results tables and analytical laboratory data can be found in Appendix E.

6.2.1 CAMU Groundwater Sampling Results

During the 2H2014 sampling event, upgradient and downgradient locations were sampled during the event to allow for an assessment to ensure that conditions downgradient have not been impacted by the placement of materials into the CAMU. The groundwater sampling laboratory analytical detections are summarized in Appendix E: Tables 1 and 2. Results detected in excess of screening criteria (see additional discussion in Section 6.3) are depicted on Figure 14.

The electronic data submitted for this project was reviewed via the automated DuPont Data Review (DDR) process. The DDR is an automated internal review process used by DuPont to assist with the determination of data usability. Overall the data are acceptable for use as reported by the laboratory, with the exception of the results that were qualified with a "B" due to equipment blank contamination. The results of a targeted library search determined that 2,5-dimethyl furan was non-detect in all samples, and the results were qualified with a "UJ" (estimated). Results detected between the method detection limit and practical quantitation limit were qualified with a "J" as estimated values (indicating that the analyte is present, but the reported value may not be accurate or precise). All other QA/QC sample data indicate that the laboratory and field QC results met method-specific criteria, and the project data quality objectives were met. The DDR Narrative Report (included in Appendix E) lists the samples that were qualified, the specific reasons for qualification, and potential bias in reported results.

6.2.2 CAMU Surface Water Sampling Results

One upgradient and one downgradient surface water location were sampled during the event to assess whether conditions downgradient have been impacted by the placement of materials into the CAMU. The surface water analytical detections are summarized in Appendix E: Table 3.

6.3 CAMU Data Evaluation Approach

The groundwater and surface-water quality data collected at the CAMU during the 2H2014 sampling event is evaluated in this section. The purpose of the evaluation is to determine if the material added to SWMU 11 is affecting water quality in the underlying groundwater aquifer and the downgradient surface water bodies (such as the Little River).

Consistent with the GMP, data collected from upgradient monitoring wells (MW-216A and MW-216B), downgradient monitoring wells (R87-S8, R87-S9, R87-S10, MW-106A, MW-107A, MW-107B and MW-213) and Little River surface water sampling points were used for the evaluation. The data evaluation consisted of the following steps:

- Step 1: Compare the data set to applicable groundwater protection standards for each constituent;
- Step 2: Evaluate intra-well trends to determine whether an increase is attributable to facility waste management practices; and
- Step 3: Evaluate potential receptors of groundwater releases.

The findings of each of these steps are discussed in the following subsections.

6.3.1 Comparison to Groundwater Standards

In accordance with current NCDENR guidance, constituents detected in groundwater were compared to North Carolina groundwater standards established in 15A NCAC^[1] 2L .0200 (NC2L standards). Where a NC2L was not available, then the constituent was compared to the NC Interim Maximum Allowable Concentration (IMAC). Where neither a NC2L nor IMAC was available, the detected constituent was compared to the NCDENR Solid Waste Section Groundwater Protection Standards (GPS). Because shallow groundwater is not used for drinking water at the Site, the comparison to conservative health-protective screening levels for drinking water serves only as a rough guide to constituent concentrations rather than a measure of potential health risk.

During the sampling event, groundwater monitoring data were collected from two upgradient monitoring well locations and seven downgradient monitoring well locations. Figure 16 depicts their locations.

As shown in Appendix E: Table 1, 10 VOCs, six SVOCs, two Dowtherm constituents and four metals were detected in samples collected from downgradient monitoring well locations. Of the organics, one VOC (vinyl chloride) was detected above screening criteria. Consistent with historical monitoring data for SWMU 11, vinyl chloride was most frequently detected above the NC2L. Vinyl chloride concentrations during the sampling event ranged from non-detect (less than 0.010 microgram per liter [$\mu\text{g/L}$]) to 1.0 $\mu\text{g/L}$. The NC2L is 0.03 $\mu\text{g/L}$.

Dowtherm® constituents (diphenyl ether and biphenyl) were detected above NC2L or NC IMAC levels in upgradient location MW-216B but were either detected below screening criteria or were not detected downgradient of the CAMU.

No inorganic constituents were detected above screening criteria.

^[1] NCAC – North Carolina Administrative Code

Recent and historical data are tabulated in Appendix F. As shown in the appendix, the constituents and concentrations that exceeded the screening criteria during the 2H2014 sampling event were consistent with historical monitoring results.

6.3.2 Intra-Well Trend Analysis

Intra-well trend analysis was conducted on all wells sampled in the monitoring program. Baseline trend charts were provided in the GMP. These trend charts depicted historical groundwater conditions measured in each individual well to establish well-specific baseline concentrations prior to CAMU construction. Results from the 2H2014 sampling event were used to update the baseline trend charts. Updated trend charts are provided in Appendix E. As shown in the appendix, no significant upward trends from baseline concentrations were identified at the downgradient monitoring well locations. At several locations, constituents have been non-detect for more than four sampling events.

6.3.3 Evaluation of Potential Groundwater Receptors

Adjacent surface-water bodies, such as the Little River, are the only current "receptors" for shallow groundwater downgradient of the Site; therefore, the surface-water bodies are the only exposure point of potential significance associated with off-site shallow groundwater migration. An evaluation of groundwater release to surface water was performed to determine whether concentrations of constituents detected in perimeter groundwater monitoring wells at SWMU 11 are likely to result in exceedances of relevant surface-water quality criteria in the downgradient Little River. Groundwater concentrations in perimeter monitoring well locations adjacent to the river (MW-106A, MW-107A/B, MW-213, R87-S8, R87-S9 and R87-S10) were compared to 15A NCAC 2B (NC2B) standards for Class C waters with an applied conservative dilution factor of 10 to account for groundwater and surface water interaction. The surface-water quality criteria used in the evaluation were based on the lower of the NC2B values for protection of freshwater organisms (chronic) and protection of human health (fish consumption). Where NC2B or National Recommended Water Quality Criteria were unavailable, NC2Ls were used. Where NC2B standards for aquatic life were not available, results were compared to USEPA Region 4 Freshwater Ecological Surface Water Values or USEPA Region 3 Biological Technical Assistance Group Freshwater Screening Benchmark values. The use of a conservative dilution factor is consistent with current USEPA RCRA Environmental Indicator guidance and the Advanced Notice of Proposed Rule Making regarding establishing point of compliance for surface water discharges.

As shown in Appendix E: Table 2, none of the constituents exceeded the adjusted screening level. Exposure to potential human receptors (such as recreational users) and ecological (aquatic) receptors of groundwater discharging to the surface-water bodies is therefore not considered significant at this time.

To confirm the findings from the groundwater-to-surface water release evaluation, surface water monitoring data were collected from the Little River during the 2H2014 sampling event. Two surface-water samples were collected (SW-6 [upstream] and SW-5 [downstream]). Figure 10 depicts the surface water locations.

Appendix E: Table 3 compares the analytical results to applicable surface water screening criteria. The surface water quality criteria used in the comparison were obtained from the sources used in the groundwater-to-surface water release evaluation. As detailed in the table, seven metals (barium, calcium, iron, lead, magnesium, manganese and zinc) were detected in the surface water samples. Of these, calcium

and zinc were also detected in the associated laboratory or field blank. Regardless, none of the constituents were detected above screening criteria.

6.3.4 CAMU Data Evaluation Conclusions

The first semi-annual interim CAMU groundwater sampling event was conducted in the second half of 2012, and semi-annual sampling has been ongoing since then. The most recent sampling event was conducted in 2H14 in conjunction with the final field investigation activities at the Site. Analysis of the data collected during these sampling events identified no significant upward trends from baseline concentrations at downgradient monitoring well locations based on an intra-well trend analysis (as presented in Appendix E). These results indicate that the RWM that was placed into the CAMU has not affected the quality of the surrounding groundwater, and there have been no adverse impacts to human health and the environment from the use of the CAMU.

7.0 UPDATED SITE CONCEPTUAL MODEL

During the historical RFI process, DuPont has strived to incorporate information from individual SWMUs and AOCs, along with more general Site data, into a facility-wide site conceptual model (SCM). The SCM provides a means of documenting and periodically updating general facility information and data regarding potential releases to the environment (USEPA Region 6 2008). The SCM also provides a framework for problem definition, aids in the identification of data gaps that can then be addressed in the investigation, and assists in the identification of appropriate remedial technologies, if necessary.

The SCM for the Former DuPont Brevard Facility was developed and designed to assess the relative potential for the Site to impact human health and the environment and to facilitate the identification of data gaps that would aid in the assessment. The assessment is based on an integrated analysis of potential exposure pathways, hazardous substance release constituent concentrations, environmental fate and transport mechanisms, and risk to human health and the environment.

The SCM includes four primary elements:

- Identification and characterization of known and potential source areas
- Preliminary identification of COPCs
- Definition of primary transport mechanisms
- Identification of potential receptors and exposure points

Each of these elements is discussed in this section. In support of the SCM, an accurate understanding of the geology and hydrogeology at the Site must also be known. A description of the regional and Site geology and hydrogeology was previously presented in Section 2.

The SCM is dynamic and should be tested and refined from its original state as information, collected in a phased approach, is fed into it. Consequently, the SCM presented herein has been updated and refined from that previously presented in the *Final Remedial Investigation Work Plan* to reflect data collection activities conducted at the Site during the 2014 Site investigation.

7.1 Identification and Characterization of Source Areas

SWMUs and AOCs present on the Site are divided up into five groups of potential contaminant sources areas on the Site: Site landfills (permitted/non), former manufacturing areas, wastewater treatment area, disposal pits and process sewers. Identified source areas are known as the probable origin of historical or current releases of a specified contaminant. Six areas were identified within the manufacturing areas of the Site through interviews with existing plant personnel that have had the potential to release process related materials and/or wastes into the environment (referred to as Former Manufacturing Areas). The potential for release from certain areas has been significantly reduced with the completion of the D&R effort (i.e., wastewater treatment, process sewers, and former manufacturing area removal).

Physical descriptions, dates of operation, and descriptions of the waste managed at each of the SWMUs and AOCs identified at the Former DuPont Brevard Facility are detailed in the *Final Remedial Investigation Work Plan*.

Potential source areas were investigated during the historical RFI. During these investigations, the majority of SWMU/AOC boundaries have been defined and their wastes characterized. As concluded in the RFI Reports (DuPont CRG, 2003, 2004 and 2008 and Parsons, 2009), confirmed releases to soil were identified at the following SWMUs and AOCs:

- AFB Settling Basin (SWMU 7)
- Former Silver Recovery Drying Bed (SWMU 9)
- Former Disposal Area – Tennis Courts (SWMU 13)
- Former Silicon Disposal Area (SWMU 15)
- Former Disposal Area 6 – Equipment Sludge Disposal (SWMU 16)
- Former Power Hill Disposal Area (SWMU 17)
- Former Disposal Area 8 – Evaporation Basin (SWMU 18)
- Fuel Oil Tank Farm (AOC A)
- Former Dowtherm® Vaporizer area (AOC J)
- Former Power House Gravel Area (AOC I)

Constituent concentrations in soil and groundwater were used to determine whether a unit was a potential source to groundwater. Potential releases to groundwater were confirmed in the vicinity of SWMUs 4, 11, 12, 13, 14, 15, 16, and 17 and the former manufacturing area⁵. SWMU and AOC locations are detailed in Figure 2.

7.2 Identification of COPCs

Analytical data collected during the historical RFI sampling events and the 2014 Site investigation were compiled for each media (soil, groundwater, surface water and sediment) and compared to generic NC DENR screening criteria described in Section 4. A comparison to generic NC DENR screening criteria has been conducted in this Section to confirm prior COPC identification for soil and groundwater and in the case of surface water and sediment to identify relevant COPCs for human health and constituents of potential ecological concern (COPECs) for ecological receptors.

A discussion of this comparison is provided in the following subsections. Exceedances of screening levels indicated in the subsections below do not in themselves indicate a confirmed release from a unit or that an unacceptable exposure exists. Rather, the screening levels serve to indicate potential for some degree of exposure to occur.

7.2.1 Soil COPCs – Direct Contact Pathways

In the *Site-Specific Remedial Levels Report* (URS, 2014), COPCs for human health direct contact exposure pathways were identified based on a comparison to IHSB PSRGs for Residential Land Use (January 2014 version). The data set evaluated included surface soil (from intervals between 0 and 2 ft bgs)⁶ and subsurface soil samples (from discrete intervals between 2 and 15 ft bgs) collected from 88 soil boring locations during the ESA and RFI.

⁵ The former manufacturing area includes SWMUs 3C and 3D and AOCs H, I, J and K

⁶ Soil or waste samples with start depths less than two feet (i.e., collected from 1 to 5 ft bgs) were conservatively included in the surface soil data set.

For this report, surface soil and subsurface soil was again compared to the IHSB PSRGs to confirm the prior COPC identification. This comparison is presented in referenced herein and discussed below.

Surface Soil

Site data evaluated included surface soil samples (from discrete intervals between 0 and 2 ft bgs) collected from 41 soil boring locations during the 1995 ESA and historical RFI activities; 50 soil discrete boring locations (collected from 0.5 to 1.5 ft bgs) and 10 ISM decision units during the 2014 Site investigation. ISM locations are shown in Figure 7. Discrete soil boring locations are detailed in Figure 8. Soil samples were analyzed for VOCs, SVOCs, PCBs, metals, Dowtherm constituents and glycols, depending on the location and sampling event. Tables 6 through 9 compares the detected constituents in discrete historical and 2014 locations, respectively, to PSRGs for residential soil (unrestricted use) and non-residential soil (industrial/commercial) and site-specific background concentrations (for inorganics). Constituents without a PSRG (such as phenanthrene) were compared to the PSRG from a structurally similar compound. Exceedances of the generic PSRGs at each applicable SWMU and/or AOC are indicated below. Exceedance locations are detailed in Figures 12 and 13.

SVOCs	
Analyte	Unit
3-Methylcholanthrene	SWMUs 15 and 16, FMA
7,12-Dimethylbenz[A]Anthracene	AOC A, FMA
Benzo(A)Anthracene	SWMUs 13, 15, 16 and 18, AOC A, FMA
Benzo(B)Fluoranthene	SWMUs 13, 15 and 16, AOC A, FMA
Benzo(K)Fluoranthene	SWMUs 15 and 16, AOC A, FMA
Benzo[A]Pyrene	SWMUs 13, 15, 16 and 18, AOC A, FMA
Chrysene	SWMU 16, FMA
Dibenz(A,H)Anthracene	SWMUs 13, 15 and 16, AOC A, FMA
Indeno (1,2,3-CD) Pyrene	SWMUs 13, 15 and 16, AOC A, FMA
Naphthalene	SWMU 16, FMA

Dowtherm		PCBs	
Analyte	Unit	Analyte	Unit
<i>Biphenyl</i>	<i>FMA</i>	<i>PCB 1242</i>	<i>FMA</i>

FMA: SWMUs 3C, 3D; AOCs H, I, J and K

Also above industrial

Inorganics	
Analyte	Unit
Antimony	FMA
<i>Arsenic</i>	<i>SWMU 13; FMA</i>
Cobalt	AOC A
Silver	SWMUs 9 and 18, AOCs C and G, FMA
Thallium	SWMUs 9, 13, 15, 16 and 19, AOCs A and G, FMA
Vanadium	SWMU 16 and FMA

FMA: SWMUs 3C, 3D; AOCs H, I, J and K

Also above industrial

PSRG exceedances were most frequently observed in the former manufacturing area. In this area, benzo(a)pyrene (BaP) most frequently exceeded the screening criteria. In the 2014 Site investigation, BaP concentrations ranged between 0.005 mg/kg and 20.9 mg/kg. The highest concentration of BaP (20.9 mg/kg) in surface soil was observed in boring location ISM DU 6.

Subsurface Soil

Site data evaluated included subsurface soil and waste samples (from discrete intervals between 1 and 15 ft bgs) collected from 47 boring locations during the 1995 ESA and historical RFI activities. Soil samples were analyzed for VOCs, SVOCs, metals, Dowtherm constituents and glycols, depending on the location and sampling event. Table 9 compares the detected constituents in the sample locations to PSRGs for residential soil (unrestricted use), PSRGs for non-residential soil (industrial/commercial) and site-specific background concentrations (for inorganics). Constituents without a PSRG (such as phenanthrene) were compared to the PSRG from a structurally similar compound. Exceedances of the generic PSRGs at each applicable SWMU and/or AOC are indicated below.

VOCs	
Analyte	Unit
1,1,2,2-Tetrachloroethane	SWMUs 13, 16 and 17
1,1,2-Trichloroethane	SWMU 16
1,2-Dichloroethane	SWMU 16
Benzene	SWMUs 13 and 16
cis-1,2 Dichloroethene	SWMU 17
Ethylbenzene	SWMU 16
Tetrachloroethene (PCE)	SWMUs 13, 16 and 17
Trichloroethene (TCE)	SWMUs 13, 16 and 17

SVOCs	
Analyte	Unit
1-Methylnaphthalene	SWMU 16
1,2-Diphenylhydrazine	SWMU 13
2-Methylnaphthalene	SWMU 16
Benzo(A)Anthracene	SWMUs 16 and 18
Benzo(B)Fluoranthene	SWMUs 16 and 18
Benzo[A]Pyrene	SWMUs 15, 16 and 18
Dibenzofuran	SWMU 16
Naphthalene	SWMU 16

Dowtherm	
Analyte	Unit
Biphenyl	SWMUs 16, 17 and 18
Diphenyl Ether	SWMUs 16 and 17

Inorganics	
Analyte	Unit
Antimony	SWMUs 16 and 18
Arsenic	SWMUs 7, 15, 16 and 18
Nickel	SWMU 16
Silver	SWMUs 16 and 18
Thallium	SWMU 18
Vanadium	SWMU 16
Zinc	SWMU 18

Also above industrial

PSRG exceedances were most frequently observed in SWMU 16. At this SWMU, the highest concentrations of constituents were observed in waste samples collected at depth intervals between 3 and 8 ft bgs. As shown in Table 9, exceedances were not observed in underlying subsurface soil samples collected at the SWMU.

7.2.2 Soil COPCs – Migration to Groundwater Pathways

Constituents detected in surface and subsurface soil were compared to PSRGs for protection of groundwater. In addition, constituent concentrations in soil and groundwater were used to determine whether a unit was a potential contamination source to groundwater. A comparison to the generic screening criteria is provided in Tables 8, 9 and 10. A summary of the COPCs is provided in Table 11 and is detailed below:

VOCs

- 1,1,2,2-Tetrachloroethane
- 1,1,2-Trichloroethane
- 1,2-Dichloroethane
- Benzene
- cis-1,2 Dichloroethene
- Tetrachloroethene
- Trichloroethene
- Vinyl Chloride

Dowtherm®

- Biphenyl
- Diphenyl Ether

Exceedances in soil were observed in less than 10% of the RFI soil samples collected. Most exceedances in waste samples were observed at SWMUs 13 and 16.

7.2.3 Groundwater COPCs

The groundwater data set evaluated for the SCM includes groundwater collected during the most recent site-wide monitoring events conducted between April 2014 and February 2015. During these monitoring events, groundwater samples were collected from the following locations:

- 50 surficial aquifer (residuum) monitoring wells
- 6 bedrock monitoring wells
- 6 water supply wells (WSW) including the WSW located at the NCDSRF Visitor Center

Groundwater samples were analyzed for TCL VOCs, SVOCs and metals, Dowtherm® constituents, and glycols, depending on the location. Monitoring well and water supply well locations are shown in Figure 3. As detailed in Section 4, groundwater results were compared to NC2Ls or IMACs (Tables 12 through 14) to confirm prior COPC identification. Exceedances of NC 2Ls or IMACs are detailed below. Exceedance locations are detailed in Figure 14.

A summary of groundwater monitoring results which includes historical RFI and CAMU groundwater monitoring data collected since 2003 is provided in Appendix F.

Surficial Aquifer**VOCs**

- 1,1,2,2-Tetrachloroethane
- 1,1,2-Trichloroethane
- 1,2-Dichloroethane
- 1,1-Dichloroethene
- Carbon tetrachloride
- Cis-1,2-dichloroethene
- PCE
- TCE
- Vinyl chloride

SVOCs

- 1,4-Dioxane

Dowtherm®

- 1,1'-Biphenyl
- Diphenyl ether

Inorganics

- Cobalt (total)
- Iron (total)
- Manganese (total)
- Thallium (total)
- Ammonia (total)

Consistent with historical monitoring events, of the organics detected, vinyl chloride was the most frequent. Concentrations of vinyl chloride ranged from between 0.012 ug/L to 120 ug/L, with the highest observed concentration detected at monitoring well location MW-222A located near SWMU 13 (see Table 12). The NC2L groundwater quality standard for vinyl chloride is 0.03 ug/L.

Of the inorganics detected, iron and manganese most frequently exceeded their respective NC2L groundwater quality standards. The highest observed concentration of iron (55,600 ug/L) was detected at monitoring well location MW-214 located near SWMU 11. The highest concentration of manganese (8,240 ug/L) was detected at monitoring well MW-211B located near SWMU 4. Iron and manganese were also detected above NC2Ls in upgradient location MW-305. The NC2L is 300 ug/L and 50 ug/L for iron and manganese, respectively.

With the exception of 1,1-Dichloroethene and thallium, the COPCs identified above were consistent with prior monitoring events. Neither constituent was detected above NC2Ls or NC IMACs in downgradient monitoring wells (MW104A/B, MW105, MW106A/B, MW107A/B, MW108, MW111A/B, MW112A/B, MW207A/B, MW210A/B, MW213, MW214, MW215, MW301A/B, MW302A/B, R87-S8, R87-S9 and R87-S10).

Bedrock Aquifer**VOCs**

- PCE
- TCE
- Vinyl chloride

SVOCs

- 1,4-Dioxane
- Dibenz(a,h)anthracene

Dowtherm®

- Diphenyl ether

Inorganics

- Chromium (total)
- Iron (total)
- Manganese (total)
- Vanadium (total)

Organic constituents detected above screening levels were primarily observed in bedrock monitoring well locations (BR-3, BR-5 and BR-9) downgradient of potential source areas (SWMUs 15 and 17). Similar to the surficial aquifer, iron and manganese most frequently exceeded screening criteria for the inorganics (see Table 13).

Site Water Supply Wells

VOCs

- TCE

Inorganics

- Iron (total)
- Manganese (total)
- Vanadium (total)

As shown in Table 14, TCE was detected above the NC2L at the WSW located at the NCDSRF Visitor Center property. SWMU 17 has been identified as a potential source of the low level of detected constituents in the NCDSRF WSW.

In January of 2009, DuPont in concert with the NC Forest Service, completed installation of a GAC water treatment system. Quarterly monitoring of the system has been conducted since third quarter 2009. Pre-treatment and post-treatment samples are collected during the monitoring events to verify treatment system effectiveness. To date, the results of the quarterly monitoring program indicate that the GAC system remains effective (DuPont CRG, 2012).

Inorganic exceedances were noted in three locations (WSW-CMPGND, WSW-GUARD and WSW-WWT), none of which are currently in use.

7.2.4 Indoor Air COPCs

Low levels of VOCs have been detected in shallow groundwater in monitoring well locations across the Site. Under current conditions, vapor intrusion pathways are incomplete. No occupied structures are located near volatile constituents in the subsurface (URS, 2014). However, new buildings may be constructed under future land use conditions. As a result, maximum groundwater detections were compared to NC DWM vapor intrusion screening levels (see Table 15). The following constituents were detected above groundwater screening levels (GWSLs):

- PCE
- TCE
- Vinyl chloride

Trichlorofluoromethane was also detected above residential GWSLs but less than non-residential GWSLs. COPC exceedances were observed in monitoring wells downgradient of SWMUs 4, 13, 15, 16 and 17.

As noted in Section 7.2.3, VOCs were detected in samples collected from NCDSRF Visitor Center WSW with one exceedance of the NC2L standard for TCE. As a result, a conservative evaluation of the potential for vapor intrusion to indoor air from groundwater pathways was performed in the *Interim Phase III RFI Report* submitted on February 29, 2008. As stated in the *Interim Phase III RFI Report*, concentrations of TCE detected in the off-site water supply well (4.9 to 9.1 ug/L) did not exceed calculated indoor air

screening levels (9.2 ug/L) protective of potential receptors (i.e., visitor center worker). Therefore, indoor air was excluded as a media of concern at the NCDSRF Visitor Center. Results of the model were provided in Appendix D of the *Interim Phase III Report*. However, NCDENR, in discussions with DuPont in May 2008, requested the collection of additional data to confirm these findings. Consequently, on September 24, 2008, DuPont collected near-slab soil gas samples along each side of the proposed NCDSRF Visitor Center building. All results from the soil gas samples were found to be non-detect at reporting limits below VISLs for commercial/industrial land use (see Table 16). Consequently, the findings of the soil gas sampling confirm the vapor intrusion modeling conducted for the NCDSRF Visitor Center. As a result, it is concluded that the low levels of TCE detected in nearby groundwater do not pose potential vapor intrusion concern to visitors or workers of the NCDSRF Visitor Center. Therefore, indoor air at the current NCDSRF Visitor Center is not considered a medium of concern.

7.2.5 Surface Water COPCs

Site data evaluated for the SCM included 19 surface-water samples collected during the most recent 2014 Site investigation. Surface water sample locations are detailed in Figure 10. Four of the samples were collected from Little River (SW4, SW-5, SW-6 and SW-7), one sample was collected from the drainage ditch along the northern and eastern boundary of SWMU 14 (SW-BALLFIELD), 10 are associated with Lake DERA (SW-14, SW-27 – SW-35), three samples are along the tributary connecting Lake DERA to the Little River (SW-8, SW-9, and SW-10) and one (SW-26) collected from a seep located downgradient (east) of the former wastewater treatment plant. The surface-water samples were analyzed for VOCs, metals (total and dissolved), Dowtherm constituents, glycols and hardness.

A summary of surface water monitoring results which includes historical RFI and CAMU surface water monitoring data collected since 2003 is provided in Appendix F.

Protection of Human Health

A comparison of constituents detected in surface water to NC 2B standards is provided in Table 17. As shown in the table, NC 2B standards (human health) were not exceeded in Little River, Lake DERA, DERA Creek or SWMU 14 drainage ditch. However, vinyl chloride was detected above NC 2B standards in the seep sample (SW-26). The seep does not provide any recreational value.

Protection of Ecological Receptors

As indicated in Section 4, constituents detected in surface water were compared to NC2B Standards for protection of freshwater organisms. Where NC2B standards were not available, additional sources were used including the National Recommended Water Quality Criteria for the protection of aquatic life (NWQC; USEPA 2014). Table 18 provides the selected surface water ESVs and their sources.

A comparison of constituents detected in surface water to NC 2B standards and other ESVs is provided in Table 19. As shown in the table, one inorganic (iron) was detected above NC 2B standards for aquatic life in one location (SW-8) in DERA Creek. However, no exceedances were observed in locations sampled further downstream prior to confluence with Little River (see Figure 15).

In other samples collected, iron was also detected above NC 2B standards for aquatic life in the SWMU 14 drainage ditch (SW-BALLFIELD) and in the seep sample (SW-26).

An additional inorganic (manganese) was detected above the surface water ESV in the SWMU 14 drainage ditch, the seep sample and three locations in the DERA Creek tributary (SW-08, SW-09 and SW-10). No exceedances were observed in Little River or Lake DERA.

Additional evaluation of iron and manganese in surface water is presented in Section 7.7.

Pore water samples were also collected during the 2014 Site investigation from 11 locations to increase understanding of the connection between Site groundwater and Site surface water features. Constituents detected in pore water were compared to NC 2B standards for protection of aquatic life and ESVs consistent with the surface water evaluation. As shown in Table 20, no constituents were detected above 2B standards or other ESVs.

One constituent, ethyl chloride, did not have available screening criteria. This constituent, which is a degradation product of vinyl chloride, was detected in one location (PW-05) at an estimated concentration of 0.1 J ug/L. Based on this limited detection, ethyl chloride is not likely to cause population-level adverse effects on aquatic organisms. As a result, pore water was not retained as a medium of concern.

7.2.6 Sediment COPCs

During the 2014 Site investigation, paired sediment samples were collected from 18 of the 19 surface water sample locations. Sediment sample locations are detailed in Figure 10. Samples were analyzed for Appendix IX VOCs, SVOCs and metals, glycols, acid volatile sulfides and grain size.

Protection of Human Health

A comparison of constituents detected in sediment to generic PSRGs for residential soil is provided in Table 21. As shown in Table 21, the following constituents were detected above the screening criteria:

SVOCs

- Benzo(a)anthracene
- Benzo(b)fluoranthene
- Benzo(k)fluoranthene
- Benzo(a)pyrene
- Dibenz(a,h)anthracene
- Indeno(1,2,3-cd)pyrene

Inorganics

- Arsenic
- Iron
- Manganese
- Thallium

Exceedances in the Little River were limited to one location (SED-05). At that location, benzo(a)pyrene was detected at an estimated concentration of 0.016 J mg/kg. (The

generic PSRG is 0.015 mg/kg). No other constituents were detected above screening criteria at that location.

Likewise, exceedances near the Lake DERA swimming area were limited. At one location (SED-14), benzo(a)pyrene was detected at an estimated concentration of 0.018 J mg/kg. Arsenic was detected at an estimated concentration of 0.782 J mg/kg. (The generic PSRG is 0.61 mg/kg). At a different location (SED-31), iron was detected at a concentration of 11,600 mg/kg. (The generic PSRG is 11,000 mg/kg). No other exceedances were observed in the swimming area samples (see Figure 15).

Exceedances were also observed in samples collected across the lake away from the swimming area (SED-28, SED-29, SED-30, SED-33 and SED-34), in sediment samples collected in DERA Creek (SED-09, SED-10) and in the seep (SED-26). To further evaluate the generic PSRG exceedances at these locations and the other aforementioned locations, site-specific recreational screening levels were calculated. As future use of Lake DERA will be allowed as part of special use permits by the NC Department of Agriculture and NC National Guard (NCNG), the SLs were derived using similar exposure assumptions as was used for Trail Users in the RL derivation (i.e., an exposure frequency of 108 days per year). Site-specific recreational screening levels are provided in Appendix G.

A comparison to the site-specific recreational screening levels is provided in Table 21. As shown in the table, COPC concentrations in Little River location SED-05 or Lake DERA swimming area locations SED-14 and SED-31 were less than the lowest calculated screening level.

COPC concentrations at the other locations were also less than the lowest calculated screening level or within the range of screening levels. A comparison to the screening levels is considered conservative for these other locations since direct contact by potential future receptors is unlikely to occur. Access to sediment away from the swimming area or within the center of the lake would either not occur or not occur as frequently as assumed in the screening level derivation. Furthermore, DERA Creek and the seep do not provide any recreational value, including fishing.

Protection of Ecological Receptors

As indicated in Section 4, constituents detected in sediment were compared to USEPA Region 4 ecological sediment benchmarks, where available (USEPA, 2001b). When a USEPA Region 4 sediment ESV was not available for a constituent, various sources were used, including the following, to identify a sediment ESV:

- USEPA Region 5 Ecological Screening Benchmarks (USEPA, 2003a)
- USEPA Region 3 BTAG Sediment Screening Benchmarks (USEPA, 2006)
- Canadian Interim Sediment Quality Guidelines (ISQG) and Probable Effects Level (PEL) as developed by the Canadian Council of Ministers of the Environment (CCME, 2013)
- Risk Assessment Information System (RAIS; <http://rais.ornl.gov/>)

Table 22 provides sediment ESVs used in the sediment evaluation and their sources.

A comparison of constituents detected in sediment to these ESVs is provided in Table 23. As shown in the table, the following constituents were detected above the screening criteria:

VOCs

- 1,1-Dichloroethane
- Acetone
- Carbon disulfide

SVOCs

- Anthracene
- Benzo(a)anthracene
- Benzo(g,h,i)perylene
- Benzo(k)fluoranthene
- Benzo(a)pyrene
- Chrysene
- Dibenz(a,h)anthracene
- Fluoranthene
- Fluorene
- Indeno(1,2,3-cd)pyrene
- Phenanthrene
- Pyrene

Inorganics

- Iron
- Lead
- Manganese
- Selenium
- Silver

Of the VOCs, only acetone was detected above ESVs in more than one location. PAHs exceeded ESVs in two locations: one in Lake DERA (SED-28) and one in DERA Creek tributary (SED-09). Of the inorganics, only manganese was detected above ESVs in more than one location. Manganese exceedances were observed in the seep (SED-26) and in DERA Creek (SED-09 and SED-10). Exceedance locations are shown in Figure 15.

Further evaluation of these COPECs is presented in Section 7.7.

7.3 Definition of Primary Transport Mechanisms

Based on the chemical and physical properties of the COPCs identified above and the known physical, topographic, meteorological, and hydrologic conditions at the Site, potential migration pathways include the following:

- Surface runoff during rain events into drainage ditches and storm sewers (historically before site dismantlement).

- Airborne transport of particulates generated by wind erosion of Site surface soils and physical disturbance of Site surface and subsurface soils in SWMUs or AOCs to downwind locations.
- Leaching of constituents in Site soils (surface and subsurface) to shallow groundwater.
- Vapor intrusion of volatile constituents in the subsurface (soil and groundwater) to the indoor air of overlying occupied structures. However, as discussed in Section X.2.4 of this report, vapor intrusion is not expected to be a concern under current conditions.
- Migration of dissolved constituents in shallow groundwater beneath the Site vertically to the deeper bedrock aquifer and horizontally to downgradient locations, including the Little River.

Based on the hydrogeologic SCM developed for the Site, the surficial aquifer is in communication with the Little River. The Little River flows from the south to north across the Site and may receive discharge for the overburden/over-bank portion of the surficial aquifer. Groundwater flow within the bedrock aquifer is also to the east/southeast towards the Little River. However, direct communication between the bedrock aquifer and the river is limited to the extent of the river between High Falls and Hooker Falls where the residuum thins and bedrock outcrops have been observed. The bedrock aquifer does not appear to be in direct communication with the extent of the river between Bridal Veil Falls to High Falls [see Figures 12- 20 and Appendix A in the Phase III RFI Report (Parsons, 2009)]. As discussed in Section 7.3, no COPECs were identified in porewater samples collected from Little River. Likewise, NC 2B standards were not exceeded in Little River surface water.

7.4 Identification of Potential Receptors and Exposure Points

An exposure pathway consists of the following:

- Source of constituents
- Mechanism of constituent release to the environment
- Transport or exposure medium containing the constituents
- Exposure point where human or ecological receptors can contact the exposure medium
- Exposure route (e.g., inhalation, ingestion, or dermal contact)

All of these elements must be present for an exposure to occur. Figure 17 depicts exposure pathways by which human or ecological receptors may be exposed to constituents in environmental media under current land-use and water-use conditions. The purpose of this figure is to identify chemical sources and exposure pathways that can result in human or ecological exposure; to aid in identifying data needs to address significant chemical release and migration pathways for quantifying potential health risk; and, to aid in identifying effective remedial alternatives that are targeted at significant contaminant sources and exposure pathways.

The model in Figure 17 shows both potentially complete and incomplete pathways. Potentially complete and incomplete pathways for each of the potential receptors defined below are discussed in the following sections.

7.4.1 Potential Receptors

Potential receptors are defined as human individuals or populations and environmental systems that are potentially exposed to constituents associated with the Site. The Site is no longer used for manufacturing operations and physical assets have been dismantled and removed. Currently, wooded areas and surface-water bodies adjacent to the Site are popular recreational locations for the surrounding community.

Surface water bodies at and adjacent to the Site⁷ include Little River, Lake DERA and DERA Creek. The Little River is classified by NCDENR as Class C fresh surface water (aquatic propagation and survival, fishing, wildlife, secondary recreation, and agricultural use). In addition, the Little River has a supplemental classification of Class TR (Trout Waters - intended to protect freshwaters for natural trout propagation and survival of stocked trout).

Lake DERA, also known as Lake DuPont, is an approximate 19-acre lake located in the northwest of the former manufacturing area. The lake features a silty bottom, with limited amounts of submerged aquatic vegetation (SAV) along its shallower reaches. An assessment of Lake DERA was conducted by the North Carolina Wildlife Resources Commission on August 10, 2010. The assessment consisted of a snorkel survey and use of a YSI® Pro20 to develop a temperature and dissolved oxygen profile of the lake. The snorkel survey revealed that the northern portion of the lake is shallow and contains some emergent vegetation which serves as habitat for young-of-the-year and adult littoral fish species. Overall, fish density and diversity were low; three fish species were observed: largemouth bass (*Micropterus salmoides*), bluegill (*Lepomis macrochirus*), and redbreast sunfish (*Lepomis auritus*). YSI® measurements confirmed that the relatively shallow Lake is fully mixed by wind and has adequate dissolved oxygen levels throughout the water column. Consequently, the ecological quality of Lake DERA is considered moderate due to limited aquatic vegetation and a low diversity of aquatic life (URS, 2011).

DERA Creek flows from west to east (Lake DERA to Little River) through the Site, and has year-round flow. During an ecological assessment of the Site conducted in 2011, bluegill and bass were observed in the outfall pool, just east of the Lake DERA dam; however, sediments in this area were notably marked by iron flocculant (URS, 2011). Swamp Forest-Bog and Acidic Cove Forest were found to occur along the creek, limiting access. In addition, the creek is too shallow for swimming, canoeing or rafting.

Planned future use of the Site include military training and recreational uses consistent with land use plans identified by the NC Department of Agriculture and NCNG and DuPont State Recreational Forest staff (DSRF). Specifically,

- NCNG Military Training with lodging and administration facilities
- Forest Ranger Office
- Parking for surrounding DuPont State Recreational Forest
- Managed recreation center at Lake DERA for Wounded Warrior REHAB, including primitive camping, water recreation and designated fishing areas
- Multi-Use Trail in Nature Preserve Primary Area

⁷ If the Site is transferred to the State of North Carolina, then the Little River and NCDSRF Visitor Center would be within the Site boundary

Therefore, the following potential receptors were identified, given the Site setting and land uses at and adjacent to the Site:

- **Current/Future Recreational User of Little River**
Little River between Bridal Veil Falls and High Falls may be used for swimming, wading or fishing.
- **Current/Future NCDSRF Visitor Center Worker**
Water drawn from deeper wells screened in the bedrock aquifer is currently used for potable purposes at the NCDSRF Visitor Center. Therefore, workers at the NCDSRF Visitor Center were considered potential receptors.
- **Future North Carolina National Guard (Military Exercises and Training)**
The NCNG has identified the larger parking lot located near the former manufacturing area for training. The motorcycle and driving course would be designed using the parking lot and the looping roads around the plant Site. The lot would also be used to stage significant events, such as large training exercises, staging of equipment and helibase functions. Temporary housing (Quonset huts), latrines and administration buildings are also proposed.
- **Future DuPont State Recreational Forest Worker (Ranger Office/ Lake DERA Recreation Area Worker)**
The DSRF staff has proposed a new Ranger Office, near the current entrance to the Site off Staton Road. A worker may also be hired to assume daily operations of managed recreation at Lake DERA.
- **Future On-Site Utility/Excavation Worker**
Future on-site utility/excavation workers are assumed to repair or install sanitary sewer, electrical, water, or other utility lines at the Site. For this receptor, it was conservatively assumed that exposure would occur each year during different repair or maintenance events.
- **Future DuPont State Recreational Forest User (Adult/Child Trail User)**
A variety of trails will be accessible to DSRF users. A multi-use trail (hiking, biking and horseback riding) is proposed in the Nature Preserve Primary Area. SWMUs and AOCs are not located in this area. Recreational users of the NCDSRF Visitor Center facilities (restrooms) were also considered potential receptors.
- **Future Recreational User of Lake DERA**
Proposed Lake DERA activities are proposed to be permitted use only (i.e., not open to the public). The existing campground and swimming area are proposed to be used for supervised swimming, camping and fishing as part of the Wounded Warrior REHAB site. SWMUs and AOCs are not located near this area.

Following re-development, unrestricted use of the Site will occur. Therefore, trespassers were not considered potential receptors. In addition, NCNG and DSRF staff will be present on Site to coordinate NCNG's activities and security needs with permitted Site uses.

Residential users of shallow groundwater have not been identified downgradient of the Site. Furthermore, the downgradient Little River is not used for water supply purposes. A water well survey completed during the final investigation, confirmed that downgradient users of deep groundwater in the immediate vicinity of the Site (within 0.25 miles of the

Site border) are limited to the NCDSRF Visitor Center (which has a water treatment unit installed). The drinking water source for municipal groundwater in the surrounding area is Cathey's Creek, Bradley Creek or the North Fork of the Mills River, each of which is over 5 miles from the Site. Therefore, off-site residents and off-site workers (outside of the DSRF) were not considered potential receptors.

As noted above, an ecological assessment was completed for the Site in 2011. The purpose of this effort was to identify, evaluate, and document the presence of unique features and/or significant ecological resources (URS, 2011). The assessment concluded that, aside from the former plant area, the overall Site resources when considered collectively are considered to represent a significant natural area that encompasses approximately 316 acres and supports an important complex of high quality environments and a broad diversity of species. As identified by the NC Natural Heritage Program, there are rare and unique resources present at the Site that are valuable as linkages with similar communities in the adjacent DuPont State Forest (i.e., Acidic Forest Cove) or represent unique patches of regionally and nationally rare habitats (e.g., Low Elevation Granitic Domes). These resources provide a suite of both common and unique habitats for both resident and migrant wildlife, including documented threatened and endangered species. Notable species identified at the Site include swamp pink (*Helonias bullata*), French Broad heartleaf (*Hexastylis rhombiformis*), green salamander (*Aneides aeneus*), and Timber Rattlesnake (*Crotalus horridus*). Significant ecological communities are detailed in Figure 18.

7.5 Potentially Complete Human Health Exposure Pathways

The model in Figure 17 shows both potentially complete and incomplete pathways. A description of each of the potentially complete exposure pathways is provided below by exposure medium. Incomplete exposure pathways are discussed in Section 7.6.

7.5.1 Surface Soil

Receptors potentially exposed to COPCs in surface soil (defined as 0 to 2 feet bgs) include future NCNG personnel during military exercises and training, future DSRF workers, future utility/excavation workers and future trail users. Potentially complete exposure pathways for each of these receptors may include:

- incidental ingestion of and dermal contact with surface soil; and,
- inhalation of soil-derived particulates.

The potential for exposure is low for most receptors because the principal areas of surface-soil impact within the former manufacturing area (where most activities by the NCNG are expected to occur) are covered by some of sort of hard surface cover (gravel, concrete, or asphalt). Other COPC exceedance locations (such as SWMUs 13 and 16) are away from proposed future land re-use areas. The receptor with the greatest potential for exposure is the utility/excavation worker, where a greater likelihood of direct contact with impacted soil is associated with intrusive activities.

7.5.2 Subsurface Soil

COPCs were identified in subsurface soil (defined for direct contact as depths between 2 and 15 ft bgs) at SWMUs 7, 13, 15, 16, 17 and 18. With some exception, a two-foot soil cover was confirmed at each of these areas. Because exposure to subsurface soil is only achieved during excavation and construction activities and access to subsurface

soil in these areas will be restricted, the only potential receptor is the future utility/excavation worker. Potentially complete exposure pathways for this receptor may include:

- incidental ingestion of and dermal contact with subsurface soil; and,
- inhalation of subsurface soil-derived particulates.

7.6 Incomplete Human Health Exposure Pathways

The following section provides the rationale for identifying potential exposure pathways as incomplete. Mitigating factors were used in the evaluation of the completeness of an exposure pathway for this human health SCM. The evaluation of mitigating factors uses logical and scientifically defensible reasoning based on a broader, more site-specific understanding of the SCM to predict more accurately the potential effects of evaluated releases.

Mitigating factors may include caps and covers that minimize the potential for direct contact, groundwater-use restrictions, or institutional controls established to minimize exposure to potential future receptors.

7.6.1 Subsurface Soil

COPCs in subsurface soil would only be accessible during intrusive activities. Since future DSRF workers, future NCNG users, and future trail users would not conduct intrusive activities, direct contact (ingestion or dermal contact) with subsurface soil is not anticipated for these receptors and is incomplete. Furthermore, subsurface soil restrictions will be established upon transfer of the Site from DuPont to NCDA&CS. A Soil Use/Excavation Management Plan will be put in place and be followed to ensure compliance with these restrictions. Restrictions will include the prohibition of any intrusive activity at certain SWMUs and AOCs (“Do Not Dig” areas). Other designated SWMUs and AOCs (“Restricted Areas”) will require pre-use testing to determine what type of health and safety measures (such as personal protection equipment), if any, are required.

7.6.2 Groundwater

Surficial Aquifer

COPCs were identified in surficial aquifer monitoring wells. Under current conditions, groundwater from the surficial aquifer is not used on-site for drinking water purposes and future use will be prohibited as part of a Groundwater Use and Restrictions Plan. However, shallow groundwater may discharge to the Little River. A portion of shallow groundwater may also discharge to DERA Creek. Since DERA Creek flows into Little River, Little River is considered the ultimate receptor of Site shallow groundwater discharge. The Little River is not used for water supply purposes.

Groundwater in the surficial aquifer is not currently used on or in the immediate vicinity of the Site as drinking water. Deed restrictions would prohibit its use on-site as drinking water in the future.

Therefore, in these instances, direct contact (ingestion or dermal contact) with groundwater for on- and off-site receptors is incomplete under current and future land use conditions.

Bedrock Aquifer

Groundwater in the bedrock aquifer is currently used on-site for sanitary purposes and off-site at the NCDSRF Visitor Center for potable and sanitary uses. COPCs were not identified in the on-site water supply well (WSW-VISIT) currently used and an interim remedial measure (IRM) has been completed at the NCDSRF Visitor Center. Therefore, direct contact (ingestion or dermal contact) with deep groundwater for on- and off-site receptors is incomplete under current land use conditions.

Potable sources of drinking water may be available for future users from existing water supply wells (WWW-VISIT and WWW-YMCA). DuPont will work closely with NCNG and DSRF staff to identify where potable use of deep groundwater as drinking water is acceptable.

7.6.3 Indoor Air

Under current conditions, vapor intrusion pathways are incomplete. No occupied structures are located near volatile constituents in the subsurface. DuPont will work closely with the NCNG and DSRF to identify areas of the Site where re-development (placement of structures) will be restricted or where engineering controls would be required for any new construction.

7.6.4 Surface Water

One COPC was identified in an intermittent seep (SW-26) located near the former wastewater treatment plant. This area does not support any recreational activities. As a result, surface water exposure pathways for potential receptors are considered incomplete in this area.

The potential exposure pathways related to food would be indirect exposure from fish or aquatic organisms in surface water. Since no exceedances of surface water or pore water screening criteria were observed in Little River or Lake DERA surface water samples, exposure pathways associated with food are considered insignificant.

7.6.5 Sediment

As discussed in Section 7.2.6, COPCs were not detected in sediment above site-specific recreational screening levels. As a result, sediment exposure pathways for potential receptors are considered incomplete.

7.7 Ecological Evaluation

COPECs identified in surface water and sediment were further refined based on a combination of the following considerations that are relevant for evaluating the potential for population-level adverse effects on aquatic and benthic organisms:

- **Alternate ESVs:** Alternate ESVs were used that are more appropriate than Step 1 ESVs, but still protective of the ecological receptors under consideration (namely aquatic and benthic organisms). These ESVs and their sources are shown in Tables 24 and 25.
- **Frequency and Magnitude of ESV Exceedance:** The frequency of the samples that exceed an ESV indicates the spatial extent of potential adverse effects, whereas the magnitude of exceedance indicates the severity of potential adverse effects [e.g., a hazard quotient (HQMean) based on mean

concentration and the respective ESV]. A $HQ > 1.0$ is generally requires further evaluation, except in cases where the HQ is known to be over-estimated due to conservative exposures and/or effects assumptions. Guidance is not available on what frequency of exceedance is considered unacceptable, but adverse effects on more than 20% of a population are generally considered unacceptable (Sample et al., 1996). The sampling locations for the Site provide sufficient spatial coverage of the available ecological habitats (e.g., DERA Lake, DERA Creek and Litter Run, see Figure 18). Hence, an exceedance frequency of $< 20\%$ is equated with potential effects on $< 20\%$ of the aquatic and benthic receptor populations within the Site. Based on these considerations, a constituent is not considered to pose population-level adverse effects if its frequency of exceedance is less than 20% and HQ_{Mean} is marginally greater than 1.0.

- **Frequency of Detection:** Similar to the exceedance frequency, detection frequency (i.e., percentage of samples at which a constituent was detected above the MDL) can also be considered to evaluate the spatial extent of the potential adverse effects (USEPA, 2001a), but specific guidance is not available. Given the spatial coverage of the available data, a constituent detected at limited number of locations (e.g., at $< 20\%$ of the locations) is consider to be unlikely to cause population-level adverse effects.
- **Background Concentrations:** Constituents with concentrations that are comparable to the levels expected in the background are not considered site-related and hence do not contribute to adverse effects that are attributable to the Site. Sources of background data have been identified and discussed in the appropriate sections below.
- **Constituent Bioavailability:** Constituents that are expected to have limited bioavailability at Site conditions are not likely to cause adverse effects and hence do no contribute significantly to the potential site-related adverse effects.

Where applicable, the factors listed above were considered for further evaluation of the COPECs identified following the Step 1 Screening. Specific discussions for media-specific evaluations are provided in the following sections.

7.7.1 Surface Water

Two surface water COPECs (iron and manganese) were identified for further refinement.

Iron

Iron has a low exceedance frequency of 17.6% (3 out of 17 samples) and an $HQ_{Mean} = 1.5$ (see Table 24). The three exceedances for iron occur at one location in DERA Creek (SW-08), at SWMU 14 drainage ditch (SW-BALLFIELD), and the seep located east of the former WWTP (SW-26). However, as discussed further in Section 7.7.2, background iron sources are likely to contribute significantly to surface water concentrations. In addition, iron has generally limited bioavailability. Based on these factors, iron is not likely to cause population-level adverse effects to aquatic organisms.

Manganese

Manganese, on the other hand has an exceedance frequency of 29.4% (or 5 of 17 samples) and $HQ_{Mean} = 4.3$ (see Table 24). Manganese exceedances occur within DERA Creek (SW-08, SW-09, and SW-10), at SWMU 14 drainage ditch (SW-BALLFIELD), and

at the seep (SW-26). However, like iron, manganese is also ubiquitous in the environment. In particular, in the Piedmont Blue Ridge region, bedrock and overlying geologic materials contain manganese bearing minerals and geochemical conditions in the aquifer facilitate manganese transport (Chapman, 2013). Hence, background sources are likely to contribute significantly to surface water concentrations. Additionally, the surface water ESV for manganese (0.12 mg/L) is over-protective with respect to fish and daphnids populations, with reported 20% effects concentrations (EC20) of 1.27 and 1.11 mg/L (Suter and Tsao, 1996). Surface water manganese concentrations are 0.51 mg/L or lower except at the seep (SW-26, 6.88 mg/L), which likely does not provide a viable aquatic habitat. Based on potential background contributions, over-protectiveness of the ESV, and habitat considerations, surface water manganese at the Site is not likely to cause population-level adverse effects to aquatic organisms.

7.7.2 Sediment

Thirteen (13) COPECs were identified for further refinement.

Metals

Seven metals were identified as COPECs in sediment: iron, lead, manganese, selenium, silver, beryllium, thallium and tin. In the refinement of iron, lead, manganese, selenium, and silver, an alternate sediment ESV was identified only for lead (see Table 25). A limited number of samples exceeded the Step 1 or alternate ESVs for these five metals (see Table 25): 16.7% (3 out of 18 samples) for manganese and 5.5% (1 out of 18 samples) for the other four COPECs. Iron, manganese, and silver exceedances occurred at the seep (SED-26), which is not likely to provide suitable habitat for sediment-dwelling organisms; and, two additional exceedances for manganese occurred in DERA Creek (SED-09 and SED-10) (see Figure 15). Selenium and lead exceedances occurred at one location (SED-33) in Lake DERA. The HQ_{Mean} for these metals were generally less than 1.0, except for manganese ($HQ_{Mean} = 1.2$). As noted earlier, background geochemical conditions are likely to contribute significantly to sediment manganese concentrations. In addition, these metals likely have lower bioavailability in the Site sediments than the assumed 100% bioavailability inherent in a screening-level evaluation. For instance, iron bioavailability is limited due to its low aqueous solubility between pH 5 and 8 (USEPA, 2003b).

Based on the limited exceedances (frequency and HQ_{Mean}) and likely limited bioavailability, these sediment metals are unlikely to cause population-level adverse effects on the benthic organisms.

For beryllium, thallium, and tin, relevant sediment ESVs could not be identified. The maximum concentrations of these metals in the Site sediments are generally comparable to the US background ranges: 1-15 mg/kg for beryllium, 5.8-10 mg/kg for thallium, and 5 mg/kg for tin (Mirecki and Falls, 2002; CCME, 1999; Buchman, 2008). At maximum concentration at or near background, incremental potential adverse effects due to these metals (relative to background levels) are not likely to be of significance.

VOCs

Four VOCs were identified as COPECs: 1,1-dichloroethane, acetone, carbon disulfide and iodomethane. For further evaluation of 1,1-dichloroethane, acetone, and carbon disulfide, alternate sediment ESVs were identified (see Table 25). Maximum concentrations of these VOCs in the Site sediments did not exceed the alternate ESVs. Hence, these VOCs do not cause adverse effects on benthic organisms at the Site.

For iodomethane, a sediment ESV could not be identified. However, it was detected in a limited number of samples (11.1% of the samples or 2 out of 18 samples). Based on the limited detection, and low bioavailability in bulk sediment, it is unlikely to cause population-level adverse effects to benthic organisms at the Site.

SVOCs

For PAHs, a limited number of samples exceed the ESVs (see Table 25): 11.1% (or 2 out of 18 samples). These two samples (SED-09 in DERA Creek and SED-28 in Lake DERA) are discrete locations with no apparent spatial relationship or history of site-related releases. Site-wide HQ_{Mean} were less than 2.0. Based on these observations, PAHs in Site sediments are unlikely to cause site-wide population-level adverse effects on benthic organisms for reasons similar to those identified above for metals and VOCs.

7.8 Site-Specific Remedial Level Evaluation

Consistent with NCDENR February 27, 2014 document entitled “Establishing Remediation Goals for the DuPont Brevard Facility”, site-specific RLs for groundwater and soil were developed for the protection of human health and the environment based on planned future uses.

RLs were developed for the following:

- Groundwater concentrations protective of receptors in Little River (human and ecological)
- Soil concentrations protective of potential groundwater receptors (Little River)
- Direct contact soil concentrations protective of potential future land use scenarios, i.e., military and recreational.

Comparison of constituents detected in soil and groundwater to these RLs is discussed in this Section. The technical approach and RL calculations are provided in the document *Site-Specific Remedial Levels* (URS, 2014), which has been included as Appendix C.

7.8.1 Site-Specific Groundwater Remedial Levels

Groundwater remedial levels [hereafter referred to as alternate concentration limits (ACLs)] were calculated to be protective of potential human and ecological receptors in the Little River.

The approach for the ACL derivation was to essentially run groundwater mass flux calculations backwards to establish an ACL at the point of compliance (POC) considering an initial risk-based concentration in the Little River (the point of exposure [or POE]). First, acceptable levels protective of human health or aquatic life (such as NC 2B values) were identified for the POE. Second, an attenuation factor (AF) based on dilution into the receiving water body was calculated. The ACL was then determined by multiplying the risk-based POE value by the site-specific AF (500).

Table 26 provides a comparison of the derived ACLs to the maximum detected concentration in site-wide groundwater and POC locations⁸. These ACLs are considered

⁸ Surficial and bedrock aquifer perimeter monitoring wells (BR-1, BR-3, BR-5, BR-9, BR-11, MW104A/B, MW105, MW106A/B, MW107A/B, MW108, MW111A/B, MW112A/B, MW207A/B, MW210A/B, MW213, MW214, MW215, MW301A/B, MW302A/B, R87-S8, R87-S9 and R87-S10)

conservative because other attenuation mechanisms such as degradation, dispersion or adsorption were not considered in the calculation.

Consistent with prior findings, groundwater data does not indicate the potential for groundwater to discharge to surface water bodies above NC 2B standards. As shown in Table 26, none of the constituents were detected above ACLs. In addition, constituents were not detected in Little River pore water or surface water above NC 2B standards (see Tables 20 and 17). Finally, groundwater concentration trends continue to be stable or decreasing in downgradient CAMU monitoring wells (see Appendix E).

7.8.2 Site-Specific Soil RLs Protective of Soil Migration to Groundwater

Soil migration-to-groundwater RLs were calculated using the soil screening level (SSL) equation provided as Figure 1 in the HWS guidance. The RL calculations used NC DENR-recommended soil parameter inputs with the ACLs derived above as the target groundwater concentration.

Protection of soil migration to groundwater RLs are intended to serve as comparison levels for surface and subsurface soil to evaluate remedial action on the basis of groundwater migration to the Little River. Table 27 provides a comparison of constituents detected in soil during Site investigations to the calculated RLs. Based on a review of the data set and as indicated in the table:

- Exceedances in soil samples were observed in less than 10% of the RFI soil samples collected. No RL exceedances were noted in the 2014 Site investigation samples.
- Most exceedances in waste samples were observed at SWMUs 13 and 16, which are over 900 feet from the Little River.
- None of the COPCs have been detected in POC groundwater monitoring wells above ACLs.
- None of the COPCs have been detected in Little River or DERA Creek pore water above NC 2B standards or ESVs.
- None of the COPCs have been detected in Little River or DERA Creek surface water above NC 2B standards or ESVs.

Based on these observations, potential impact of these constituents from the migration to groundwater route to potential receptors in surface water is not expected.

7.8.3 Site-Specific Soil RLs Protective of Human Health (Direct Contact Exposure Pathways)

Direct Contact RLs are intended to serve as evaluation criteria for surface and subsurface soil to evaluate remedial action on the basis of human health exposure. RLs values protective of multiple-route exposure were calculated using USEPA risk assessment methodology (USEPA, 1989). The USEPA risk assessment equations calculate risk levels based on the constituent concentration, magnitude of exposure, and the toxicity of the constituent. To calculate the RLs, the equations were rearranged to solve for an allowable constituent concentration based on a target risk level (hazard quotient of 1 or cancer risk of 10^{-6}), magnitude of exposure, and toxicity. Consistent with Section § 130A-310.68 (b)(9) of House Bill 45 (the Risk Bill), direct contact soil RLs were derived using the range of acceptable target cancer risk levels (10^{-6} to 10^{-4}) and a target hazard quotient of 1.

COPCs for the RL derivation were identified based on the historical RFI data set. With the collection of additional surface soil data in 2014, one additional COPC was identified (PCB 1242). Appendix G includes RL calculations for this additional COPC.

Table 28 provides a summary of the RLs calculated for each potential receptor. The lower of the non-carcinogenic and carcinogenic values is shown in the table for each analyte for each receptor. The site-specific direct contact RLs presented in the table should not be considered a “not-to-exceed” concentration, but rather consistent with USEPA guidance (USEPA, 2004) are recommended to be implemented as an average concentration (such as a 95 percent upper confidence limit of the mean [UCL95]) during remedial action.

Table 29 provides a comparison of Site surface soil data to the RL range. As shown in the table, only one COPC (benzo[a]pyrene) in the discrete soil data set had a UCL above the low end of the RL range (based on a HQ=1 and a target risk of 1×10^{-6}). The COPC exceedance was observed in one historic SWMU 16 waste sample collected from a depth of 1-5 ft bgs. No benzo[a]pyrene exceeds of the lowest RLs were observed in 2014 surface soil samples collected from the SWMU. The UCL was within the mid RL range (based on a HQ=1 and a target risk of 1×10^{-5}).

One additional PAH (7,12-dimethylbenz[a]anthracene) had an exceedance in one historical discrete surface soil sample collected from AOC A above the mid RL range, but within the upper end RL range (based on a HQ=1 and a target risk of 1×10^{-4}). In addition, the constituent was not detected in 2014 ISM sampling conducted in the area.

Two COPCs (benzo[a]pyrene and dibenz[a,h]anthracene) in the ISM soil data set had UCLs above the low end of the RL range. Exceedances were observed in DU-6 for both COPCs, and DU-8 for benzo[a]pyrene only. UCLs were within the mid RL range.

8.0 CONCLUSIONS AND RECOMMENDATIONS

The conclusions and recommendations derived from the historical and current Site investigations are presented below.

8.1 Conclusions

General Overall Site Conclusions

- The Site is no longer used for manufacturing operations and has been dismantled. Planned future uses of the Site include low-impact military training and recreational uses consistent with land use plans identified by the NCDA&CS, the NCNG, and DSRF staff.
- Groundwater in the surficial aquifer is not currently used on or in the immediate vicinity of the Site as drinking water. Deed restrictions would prohibit its use onsite as drinking water in the future.
- Groundwater in the bedrock aquifer is currently used on-site for sanitary purposes and is used at the NCDSRF Visitor Center for potable and sanitary uses. An IRM has been completed at the visitor center bedrock well.
- Releases in soil (surface and subsurface) and groundwater have been identified.
- Current detections were mostly consistent with previous RFI phases.

Soil

- Concentrations in surface soils are within the range of RLs for the designated proposed future uses.
- With minor exceptions, there is adequate soil cover (two feet) above residual waste material.

Ground Water

- Consistent with prior findings, groundwater data does not indicate the potential for groundwater to discharge to surface water bodies above NC 2B standards.
- Groundwater concentration trends continue to be stable or decreasing in downgradient CAMU monitoring wells.
- Potable sources of drinking water may be available for future users from existing water supply wells.

Surface Water

- No exceedances of NC 2B standards (human health or aquatic life) or ESVs were detected in Little River or Lake DERA.
- There is limited potential for adverse ecological effects in Site surface water.

Pore Water

- Site pore water also indicates that there is limited potential for adverse ecological effects.
- There were limited detections of VOCs and SVOCs in pore water – none at concentrations exceeding ESVs.

Sediment

- Overall, the results of the final investigation showed limited potential for adverse ecological effects or for risk to human health from Site sediments.
- No exceedances of the ESVs were detected in Little River.

Data Evaluation

- The data from the final investigation supports the environmental conditions of the Site as summarized in the previously-submitted RFI reports and the Environmental Indicator (EI) reports (CA725 [Parsons 2012a] and CA750 [Parsons 2012b]). The results (as confirmed by the ongoing NCDSRF Visitor Center and CAMU sampling programs) indicate that the Site remains protective of human health and the environment.
- Consistent with the NCDENR document entitled “Establishing Remediation Goals for the DuPont Brevard Facility,” dated February 27, 2014, site-specific RLs for groundwater and soil were developed for the protection of human health and the environment based on planned future uses as proposed by the DSRF and the NCNG. These RLs were used to support the proposed remedial approach for the Site. A comparison of the final investigation results to the site-specific RLs continues to show protectiveness for the intended future uses of the property.

8.2 Recommendations

Based on the conclusions presented above, it is believed that upon approval of this report DuPont will have met the investigation reporting requirements of the Risk Bill and will be able to move forward with final remedial decision-making. As such, the following recommendations for the Site are offered:

- The Site should be moved into the Remedial Action Plan preparation stage in accordance with Section 130A-310.69 of the Risk Bill. The RAP will address remaining concerns about SWMU 17, the final closure of the SWMU 11 CAMU, and the development of future institutional controls that will be implemented at the Site.
- The current CAMU groundwater monitoring program should be continued until final remedial decision-making for the unit has been completed.
- The current GAC system monitoring program should be maintained to ensure continued protection of people and the environment.

TABLES

Table 1
SWMU/AOC Summary Table
Remedial Investigation Report
DuPont Brevard Facility
Cedar Mountain, North Carolina

Unit Number	Unit Name	Unit Description	Dates of Operation
Solid Waste Management Unit (SWMU) 1	Hazardous Waste Storage Pad	55-gallon drums stored on wooden pallets. The storage area is on a reinforced concrete pad, covered by a rood and enclosed on three sides. The pad is sloped toward a 16-inch trench with a 6-inch curb around the sides and rear.	1980-1996
SWMU 2A	HW Satellite Accumulation Area	A steel can located inside the P&O Shop building that was used to store solvent-tainted rags. The storage area rests on the shop's concrete floor and was clearly marked as hazardous waste.	1957-2003
SWMU 2B	HW Satellite Accumulation Area	Consists of a drum used to store laboratory solvents. Storage area is a steel grate pad within a shed, which was locked when not in use.	1957-2003
SWMU 2C	HW Satellite Accumulation Area	A drum used to store paint thinners. Consisted of a concrete pad enclosed inside a shed, which was locked when not in use.	1957-2003
SWMU 3A	Waste Hydrocarbon Accumulation Areas	Outdoor storage area for drums of motor and lubricating oils consisting of a wooden pallet sitting on the ground. Located south of the polishing pond, adjacent to SWMU 2C.	1957-2003
SWMU 3B	Waste Hydrocarbon Accumulation Areas	Storage area for drums of motor oil, oil filters, and anti-freeze. The storage area consists of wooden pallets that sit on gravel located under a roof between the P&O shop and the adjacent warehouse.	1957-2003
SWMU 3C	Waste Hydrocarbon Accumulation Areas	A collection area for one drum of Dowtherm. The collection area consists of a concrete pad with a wooden pallet located west of the Power House.	1957-2003
SWMU 3D	Waste Hydrocarbon Accumulation Areas	An accumulation area for drums of ethylene glycol from the Polymerization process. The storage area consists of a concrete pad located on the east side of the Casting and Stretching section of the main plant building.	1957-2003
SWMU 3E	Waste Hydrocarbon Accumulation Areas	A storage area for drums of triethylene glycol and Dowtherm. The storage area consists of a concrete pad located on the north side of the warehouse that is situated south of the Power House.	1957-2003
SWMU 4	WWTP - Aeration/settling basins, Emergency Diversion Basin, Secondary Clarifier, Polishing Pond	Consists of a horseshoe shaped pond, emergency spill basin, secondary clarification, and settling ponds. All units open-topped and unlined except the spill (emergency diversion) basin, which is clay lined.	1987 to Site Demolition in 2005 (secondary clarification began in 1990)
SWMU 5	Process Sewer System	Consists of a system of underground pipes and manholes that convey untreated process wastewater from the main plant area to the plant wastewater treatment system. Pipes are constructed of various materials including vitrified clay, reinforced concrete, and steel.	1957 to 2005
SWMU 6	Storm Sewer System	Consists of a system of drains and ditches that are generally unlined but constructed of concrete in some areas.	1957 to 2006
SWMU 7	AFB Settling Basin	An asphalt covered area consisting of the alternate fuels boiler unit and building, waste material empty drums, clarifier, used oil storage area, and a separate unlined settling basin. Most of area covered in asphalt pavement.	1991 to Plant Closure in 2003

Table 1
SWMU/AOC Summary Table
Remedial Investigation Report
DuPont Brevard Facility
Cedar Mountain, North Carolina

Unit Number	Unit Name	Unit Description	Dates of Operation
SWMU 8	PET Recycle Storage Area	Waste PET resin generated by the manufacturing process is stored in dumpsters situated on asphalt north of the power house and the east side of the C&S building.	1987-2003
SWMU 9	Former Silver Recovery Drying Bed	An area where sludges from the former evaporation basin area were spread out on a plastic liner (as a one time event) and allowed to air dry. All liners were removed during the operation, and the area was converted to a gravel parking lot in 1991.	1980-1981
SWMU 10	Former Sedimentation Basin	Consists of an inground concrete lined basin measuring approximately 20 x 20 x 6 located north of the 3B coating building and east of the 3BX coater. The unit received sanitary and process waste before the horse-shoe pond was constructed to allow sediment settlement prior to discharge to SWMU 20.	1957-1987
SWMU 11	Former East Landfill	An inactive permitted solid waste landfill that has been capped and three adjacent open-topped basins. Two of the basins were replaced with rip-wrapped drainage swales.	1972 to 1996
SWMU 12A-C	Former North Landfill	A permitted landfill that has three distinct cells: SWMU 12A contains asbestos; SWMU 12B includes demolition waste such as concrete, gravel, scrap metal, wood, cardboard; SWMU 12C contains food waste from the cafeteria. Area also consisted of a sediment-settling basin. The extents of SWMU 12 cover an area of 0.20 acre (SWMU 12A) and 0.6 acre (SWMU 12B&C).	12A - 1973 - 1992 12B- 1973 - 1992 12C- 1973 - 1996
SWMU 13	Former Disposal Area - Tennis Courts	An unlined landfill that has been capped. Disposed of domestic garbage, film scraps, weak acids, glycol, digester sludge. Unlined and capped with soil of unspecified thickness and permeability.	1972 to 1974
SWMU 14	Former Disposal Area 4 - West Landfill	An unlined landfill that was capped and formerly used as a baseball field. Used to dispose plant trash, scrap film, glycol, process liquid wastes. Was the focus of a recycling/consolidation into the CAMU effort.	1958 to 1972
SWMU 15	Former Silicon Disposal Area	An unlined disposal area that has been capped; used for scrap elemental silicon	1958 to 1962

Table 1
SWMU/AOC Summary Table
 Remedial Investigation Report
 DuPont Brevard Facility
 Cedar Mountain, North Carolina

Unit Number	Unit Name	Unit Description	Dates of Operation
SWMU 16	Former Disposal Area 6 - Equipment Sludge Disposal	Consists of one 40 by 40 foot area and two 10 by 30 foot areas. The areas are unlined and capped with soil and exhibit vegetative cover. Consisted of a disposal area for weak acids, glycols, resins, process wastes, sanitary wastes, carbon black and glycol dimethyl teraphthalate.	1974 to 1976
SWMU 17	Former Power Hill Disposal Area	Five unlined disposal areas ranging from approximately 20 feet by 65 feet to 16 feet by 22 feet. The areas have been capped with soil. Used to dispose of neutralized wasted hydrofluoric acid and miscellaneous waste liquids such as glycols, solvents, degraded polymer, resin and gel and broken thermometers.	1958 to 1977
SWMU 18A & B	Former Disposal Area 8 - Evaporation Basin	Two earthen-lined, open-topped ponds approximately 130 feet by 270 feet and five feet deep. An extension to the 3B Coater building was constructed over part of these ponds. Used as settling ponds for process wastewater containing zinc chloride.	1957 to 1963
SWMU 19	Former Disposal Area #12 - Digester Sludge Disposal Area	An unlined disposal area that has been covered with soil and extends less than one half of an acre. Used for the disposal of digester pit sludge which contained glycol and carbon black.	1971 -1972
SWMU 20	Former WWTP Settling Pond	An earthen-lined, open-topped pond approximately 120 feet by 240 feet and five feet deep.	1957 to 1990
Area of Concern (AOC) A	Fuel Oil Tank Farm	One 300,000-gallon tank, one 500,000-gallon tank, and one one-million gallon tank. The tanks were located in a bermed, gravel-lined area.	No. 2 fuel oil- 1962 to 2003 No. 6 fuel oil 500,000 gallon- 1973 to 2003 No. 6 fuel oil one million gallon- 1974 to 1992
AOC B	CP Tank Farm	Seven above-ground tanks located within a diked, gravel-lined area. Two 65,000-gallon, one 25,500-gallon, two 26,500-gallon, one 8,000-gallon, and one 25,000-gallon tanks.	Tank #1- 1963 to Tank #2- 1976 to Tank #3- 1963 to Tank #4- Unknown to Tank #5- Unknown to Tank #6- Unknown to Tank #7- Unknown to
AOC C	Save All System - Silver recovery unit	Two 10,000-gallon tanks located within a concrete-lined pit. Used to recover silver bromide from process waste.	1963 to 2003

Table 1
SWMU/AOC Summary Table
 Remedial Investigation Report
 DuPont Brevard Facility
 Cedar Mountain, North Carolina

Unit Number	Unit Name	Unit Description	Dates of Operation
AOC D	Jet Water Cooling Tower	Unit used to circulate water potentially contaminated with acid aldehyde vapors and other catalysts.	Unknown - Early 1990s
AOC E	Silver Recovery Transfer Line	An underground transfer line that runs from the R&D building along the west side of the manufacturing building to the Save-all silver recovery unit.	Unknown - Early 1990s
AOC F	Construction and Demolition Disposal Area	Disposal area located in the northeast corner of the Site near SWMU4	July 25, 1996 - December 2, 2005
AOC G	Former Sand Blasting Area	Area located off the southeastern corner of the polishing pond and north of the construction area; used in the sand blasting of metal parts relating to construction and maintenance activities.	Early 1970s - 1996
AOC H	Glycol Satellite Storage Tanks	Consists of two triethylene glycol storage tanks located adjacent to the south side of the manufacturing building, east of the courtyard for the administration building. The area was observed to be lined with concrete materials.	Early 1970s - 2002
AOC I	Powerhouse Gravel Area	A graveled area along the southeastern corner of the powerhouse located on the south side of the manufacturing building. This area was used to generate steam for the manufacturing process through the combustion of natural gas and fuel oils.	1950s - 2005
AOC J	Dowtherm Vaporizers Area	Located on the south side of the manufacturing building along the powerhouse, these vaporizers were used to super heat the Dowtherm, which acted as a heat transfer medium during the polymerization process of the polyester manufacturing process.	Early 1970s - 2002
AOC K	Glycol Hot Well Area	Located on the south side of the manufacturing building, the hot wells were used to super heat glycol materials used in the polymerization process.	Early 1970s - 2002

Notes:

MG/KG - Milligram(s) per kilogram

1 - Constituents detected in 2014 surface soil samples. Field duplicates included in statistical summary.

2 - Site-specific background concentrations presented in Phase III RFI Report.

DL - background value is the detection limit

3 - NCDENR Inactive Hazardous Site Branch Preliminary Soils Remediation Goals (March 2015)

Value for chromium is trivalent chromium.

Value for benzo(g,h,i)perylene is pyrene

Value for mercury is mercuric chloride

Value for acenaphthylene is acenaphthene

Value for diphenyl ether is DuPont-derived value.

Value for phenanthrene is anthracene

Notes:

MG/KG - Milligram(s) per kilogram

1 - Constituents detected in 2014 surface soil samples. Field duplicates included in statistical summary.

2 - Site-specific background concentrations presented in Phase III RFI Report.

DL - background value is the detection limit

3 - NCDENR Inactive Hazardous Site Branch Preliminary Soils Remediation Goals (March 2015)

Value for chromium is trivalent chromium. Value for benzo(g,h,i)perylene is pyrene

Value for mercury is mercuric chloride Value for acenaphthylene is acenaphthene

Value for diphenyl ether is DuPont-derived value. Value for phenanthrene is anthracene

	Exceeds Residential PSRG (and site-specific background for inorganics, where applicable)
	Exceeds Residential PSRG and Non-Residential PSRG (and site-specific background for inorganics, where applicable)

Notes:

MG/KG - Milligram(s) per kilogram

1 - Constituents detected in 2014 surface soil samples. Field duplicates included in statistical summary.

2 - Site-specific background concentrations presented in Phase III RFI Report.

DL - background value is the detection limit

3 - NCDENR Inactive Hazardous Site Branch Preliminary Soils Remediation Goals (March 2015)

Value for chromium is trivalent chromium. Value for benzo(g,h,i)perylene is pyrene

Value for mercury is mercuric chloride Value for acenaphthylene is acenaphthene

Value for diphenyl ether is DuPont-derived value. Value for phenanthrene is anthracene

	Exceeds Residential PSRG (and site-specific background for inorganics, where applicable)
	Exceeds Residential PSRG and Non-Residential PSRG (and site-specific background for inorganics, where applicable)

DL - background value is the detection limit

3 - NCDENR Inactive Hazardous Site Branch Preliminary Soils Remediation Goals (March 2015)

Value for chromium is trivalent chromium. Value for benzo(g,h,i)perylene is pyrene

Value for mercury is mercuric chloride Value for acenaphthylene is acenaphthene

Value for diphenyl ether is DuPont-derived value. Value for phenanthrene is anthracene

	Exceeds Residential PSRG (and site-specific background for inorganics, where applicable)
	Exceeds Residential PSRG and Non-Residential PSRG (and site-specific background for inorganics, where applicable)

Notes:

MG/KG - Milligram(s) per kilogram

1 - Constituents detected in 2014 surface soil samples. Field duplicates included in statistical summary.

2 - Site-specific background concentrations presented in Phase III RFI Report.

DL - background value is the detection limit

3 - NCDENR Inactive Hazardous Site Branch Preliminary Soils Remediation Goals (March 2015)

Value for chromium is trivalent chromium. Value for benzo(g,h,i)perylene is pyrene

Value for mercury is mercuric chloride Value for acenaphthylene is acenaphthene

Value for diphenyl ether is DuPont-derived value. Value for phenanthrene is anthracene

	Exceeds Residential PSRG (and site-specific background for inorganics, where applicable)
	Exceeds Residential PSRG and Non-Residential PSRG (and site-specific background for inorganics, where applicable)

Notes:

MG/KG - Milligram(s) per kilogram

1 - Constituents detected in 2014 surface soil samples. Field duplicates included in statistical summary.

2 - Site-specific background concentrations presented in Phase III RFI Report.

DL - background value is the detection limit

3 - NCDENR Inactive Hazardous Site Branch Preliminary Soils Remediation Goals (March 2015)

Value for chromium is trivalent chromium. Value for benzo(g,h,i)perylene is pyrene

Value for mercury is mercuric chloride Value for acenaphthylene is acenaphthene

Value for diphenyl ether is DuPont-derived value. Value for phenanthrene is anthracene

 Exceeds Residential PSRG (and site-specific background for inorganics, where applicable)

 Exceeds Residential PSRG and Non-Residential PSRG (and site-specific background for inorganics, where applicable)

Notes:

MG/KG - Milligram(s) per kilogram

1 - Constituents detected in 2014 surface soil samples. Field duplicates included in statistical summary.

2 - Site-specific background concentrations presented in Phase III RFI Report.

DL - background value is the detection limit

3 - NCDENR Inactive Hazardous Site Branch Preliminary Soils Remediation Goals (March 2015)

Value for chromium is trivalent chromium. Value for benzo(g,h,i)perylene is pyrene

Value for mercury is mercuric chloride Value for acenaphthylene is acenaphthene

Value for diphenyl ether is DuPont-derived value. Value for phenanthrene is anthracene

	Exceeds Residential PSRG (and site-specific background for inorganics, where applicable)
	Exceeds Residential PSRG and Non-Residential PSRG (and site-specific background for inorganics, where applicable)

Notes:

MG/KG - Milligram(s) per kilogram

1 - Constituents detected in 2014 surface soil samples. Field duplicates included in statistical summary.

2 - Site-specific background concentrations presented in Phase III RFI Report.

DL - background value is the detection limit

3 - NCDENR Inactive Hazardous Site Branch Preliminary Soils Remediation Goals (March 2015)

Value for chromium is trivalent chromium. Value for benzo(g,h,i)perylene is pyrene

Value for mercury is mercuric chloride Value for acenaphthylene is acenaphthene

Value for diphenyl ether is DuPont-derived value. Value for phenanthrene is anthracene

	Exceeds Residential PSRG (and site-specific background for inorganics, where applicable)
	Exceeds Residential PSRG and Non-Residential PSRG (and site-specific background for inorganics, where applicable)

Notes:

MG/KG - Milligram(s) per kilogram

Blank Cells = Constituent not detected in all three replicates

NCDENR Inactive Hazardous Site Branch Preliminary Soils Remediation Goals (March 2015)

Value for chromium is trivalent chromium.

Value for benzo(g,h,i)perylene is pyrene

Value for mercury is mercuric chloride

Value for acenaphthylene is acenaphthene

Value for diphenyl ether is DuPont-derived value.

Value for phenanthrene is anthracene

 Exceeds Residential PSRG (and site-specific background for inorganics, where applicable)

 Exceeds Residential PSRG and Non-Residential PSRG (and site-specific background for inorganics, where applicable)

Site-specific background concentrations presented in Phase III RFI Report.

DL - background value is the detection limit

Notes:

MG/KG - Milligram(s) per kilogram

1 - Constituents detected in historical surface soil samples. Field duplicates included in statistical summary.

2 - Site-specific background concentrations presented in Phase III RFI Report.

DL - background value is the detection limit

3 - NCDENR Inactive Hazardous Site Branch Preliminary Soils Remediation Goals (March 2015)

Value for chromium is trivalent chromium.

Value for benzo(g,h,i)perylene is pyrene

Value for mercury is mercuric chloride

Value for acenaphthylene is acenaphthene

Value for diphenyl ether is DuPont-derived value.

Value for phenanthrene is anthracene

	Exceeds PSRG for Protection of Migration to Groundwater (and site-specific background for inorganics, where applicable)
	Exceeds Residential PSRG (and site-specific background for inorganics, where applicable)
	Exceeds Residential PSRG and Mig to GW PSRG (and site-specific background for inorganics, where applicable)
	Exceeds Residential PSRG, Mig to GW PSRG and Non-Residential PSRG (and site-specific background for inorganics, where applicable)

Notes:

MG/KG - Milligram(s) per kilogram

1 - Constituents detected in historical surface soil samples. Field duplicates included in statistical summary.

2 - Site-specific background concentrations presented in Phase III RFI Report.

DL - background value is the detection limit

3 - NCDENR Inactive Hazardous Site Branch Preliminary Soils Remediation Goals (March 2015)

Value for chromium is trivalent chromium.

Value for benzo(g,h,i)perylene is pyrene

Value for mercury is mercuric chloride

Value for acenaphthylene is acenaphthene

Value for diphenyl ether is DuPont-derived value.

Value for phenanthrene is anthracene

	Exceeds PSRG for Protection of Migration to Groundwater (and site-specific background for inorganics, where applicable)
	Exceeds Residential PSRG (and site-specific background for inorganics, where applicable)
	Exceeds Residential PSRG and Mig to GW PSRG (and site-specific background for inorganics, where applicable)
	Exceeds Residential PSRG, Mig to GW PSRG and Non-Residential PSRG (and site-specific background for inorganics, where applicable)

Notes:

MG/KG - Milligram(s) per kilogram

1 - Constituents detected in historical surface soil samples. Field duplicates included in statistical summary.

2 - Site-specific background concentrations presented in Phase III RFI Report.

DL - background value is the detection limit

3 - NCDENR Inactive Hazardous Site Branch Preliminary Soils Remediation Goals (March 2015)

Value for chromium is trivalent chromium. Value for benzo(g,h,i)perylene is pyrene

Value for mercury is mercuric chloride Value for acenaphthylene is acenaphthene

Value for diphenyl ether is DuPont-derived value. Value for phenanthrene is anthracene

	Exceeds PSRG for Protection of Migration to Groundwater (and site-specific background for inorganics, where applicable)
	Exceeds Residential PSRG (and site-specific background for inorganics, where applicable)
	Exceeds Residential PSRG and Mig to GW PSRG (and site-specific background for inorganics, where applicable)
	Exceeds Residential PSRG, Mig to GW PSRG and Non-Residential PSRG (and site-specific background for inorganics, where applicable)

Notes:

MG/KG - Milligram(s) per kilogram

1 - Constituents detected in historical surface soil samples. Field duplicates included in statistical summary.

2 - Site-specific background concentrations presented in Phase III RFI Report.

DL - background value is the detection limit

3 - NCDENR Inactive Hazardous Site Branch Preliminary Soils Remediation Goals (March 2015)

Value for chromium is trivalent chromium. Value for benzo(g,h,i)perylene is pyrene

Value for mercury is mercuric chloride Value for acenaphthylene is acenaphthene

Value for diphenyl ether is DuPont-derived value. Value for phenanthrene is anthracene

	Exceeds PSRG for Protection of Migration to Groundwater (and site-specific background for inorganics, where applicable)
	Exceeds Residential PSRG (and site-specific background for inorganics, where applicable)
	Exceeds Residential PSRG and Mig to GW PSRG (and site-specific background for inorganics, where applicable)
	Exceeds Residential PSRG, Mig to GW PSRG and Non-Residential PSRG (and site-specific background for inorganics, where applicable)

Notes:

MG/KG - Milligram(s) per kilogram

1 - Constituents detected in historical surface soil samples. Field duplicates included in statistical summary.

2 - Site-specific background concentrations presented in Phase III RFI Report.

DL - background value is the detection limit

3 - NCDENR Inactive Hazardous Site Branch Preliminary Soils Remediation Goals (March 2015)

Value for chromium is trivalent chromium.

Value for benzo(g,h,i)perylene is pyrene

Value for mercury is mercuric chloride

Value for acenaphthylene is acenaphthene

Value for diphenyl ether is DuPont-derived value.

Value for phenanthrene is anthracene

	Exceeds PSRG for Protection of Migration to Groundwater (and site-specific background for inorganics, where applicable)
	Exceeds Residential PSRG (and site-specific background for inorganics, where applicable)
	Exceeds Residential PSRG and Mig to GW PSRG (and site-specific background for inorganics, where applicable)
	Exceeds Residential PSRG, Mig to GW PSRG and Non-Residential PSRG (and site-specific background for inorganics, where applicable)

Notes:

MG/KG - Milligram(s) per kilogram

1 - Constituents detected in historical surface soil samples. Field duplicates included in statistical summary.

2 - Site-specific background concentrations presented in Phase III RFI Report.

DL - background value is the detection limit

3 - NCDENR Inactive Hazardous Site Branch Preliminary Soils Remediation Goals (March 2015)

Value for chromium is trivalent chromium.

Value for benzo(g,h,i)perylene is pyrene

Value for mercury is mercuric chloride

Value for acenaphthylene is acenaphthene

Value for diphenyl ether is DuPont-derived value.

Value for phenanthrene is anthracene

	Exceeds PSRG for Protection of Migration to Groundwater (and site-specific background for inorganics, where applicable)
	Exceeds Residential PSRG (and site-specific background for inorganics, where applicable)
	Exceeds Residential PSRG and Mig to GW PSRG (and site-specific background for inorganics, where applicable)
	Exceeds Residential PSRG, Mig to GW PSRG and Non-Residential PSRG (and site-specific background for inorganics, where applicable)

Notes:

MG/KG - Milligram(s) per kilogram

1 - Constituents detected in historical surface soil samples. Field duplicates included in statistical summary.

2 - Site-specific background concentrations presented in Phase III RFI Report.

DL - background value is the detection limit

3 - NCDENR Inactive Hazardous Site Branch Preliminary Soils Remediation Goals (March 2015)

Value for chromium is trivalent chromium. Value for benzo(g,h,i)perylene is pyrene

Value for mercury is mercuric chloride Value for acenaphthylene is acenaphthene

Value for diphenyl ether is DuPont-derived value. Value for phenanthrene is anthracene

	Exceeds PSRG for Protection of Migration to Groundwater (and site-specific background for inorganics, where applicable)
	Exceeds Residential PSRG (and site-specific background for inorganics, where applicable)
	Exceeds Residential PSRG and Mig to GW PSRG (and site-specific background for inorganics, where applicable)
	Exceeds Residential PSRG, Mig to GW PSRG and Non-Residential PSRG (and site-specific background for inorganics, where applicable)

Notes:

MG/KG - Milligram(s) per kilogram

1 - Constituents detected in historical surface soil samples. Field duplicates included in statistical summary.

2 - Site-specific background concentrations presented in Phase III RFI Report.

DL - background value is the detection limit

3 - NCDENR Inactive Hazardous Site Branch Preliminary Soils Remediation Goals (March 2015)

Value for chromium is trivalent chromium. Value for benzo(g,h,i)perylene is pyrene

Value for mercury is mercuric chloride Value for acenaphthylene is acenaphthene

Value for diphenyl ether is DuPont-derived value. Value for phenanthrene is anthracene

	Exceeds PSRG for Protection of Migration to Groundwater (and site-specific background for inorganics, where applicable)
	Exceeds Residential PSRG (and site-specific background for inorganics, where applicable)
	Exceeds Residential PSRG and Mig to GW PSRG (and site-specific background for inorganics, where applicable)
	Exceeds Residential PSRG, Mig to GW PSRG and Non-Residential PSRG (and site-specific background for inorganics, where applicable)

Notes:

MG/KG - Milligram(s) per kilogram

1 - Constituents detected in historical surface soil samples. Field duplicates included in statistical summary.

2 - Site-specific background concentrations presented in Phase III RFI Report.

DL - background value is the detection limit

3 - NCDENR Inactive Hazardous Site Branch Preliminary Soils Remediation Goals (March 2015)

Value for chromium is trivalent chromium.

Value for benzo(g,h,i)perylene is pyrene

Value for mercury is mercuric chloride

Value for acenaphthylene is acenaphthene

Value for diphenyl ether is DuPont-derived value.

Value for phenanthrene is anthracene

	Exceeds PSRG for Protection of Migration to Groundwater (and site-specific background for inorganics, where applicable)
	Exceeds Residential PSRG (and site-specific background for inorganics, where applicable)
	Exceeds Residential PSRG and Mig to GW PSRG (and site-specific background for inorganics, where applicable)
	Exceeds Residential PSRG, Mig to GW PSRG and Non-Residential PSRG (and site-specific background for inorganics, where applicable)

Notes:

MG/KG - Milligram(s) per kilogram

1 - Constituents detected in historical surface soil samples. Field duplicates included in statistical summary.

2 - Site-specific background concentrations presented in Phase III RFI Report.

DL - background value is the detection limit

3 - NCDENR Inactive Hazardous Site Branch Preliminary Soils Remediation Goals (March 2015)

Value for chromium is trivalent chromium.

Value for benzo(g,h,i)perylene is pyrene

Value for mercury is mercuric chloride

Value for acenaphthylene is acenaphthene

Value for diphenyl ether is DuPont-derived value.

Value for phenanthrene is anthracene

	Exceeds PSRG for Protection of Migration to Groundwater (and site-specific background for inorganics, where applicable)
	Exceeds Residential PSRG (and site-specific background for inorganics, where applicable)
	Exceeds Residential PSRG and Mig to GW PSRG (and site-specific background for inorganics, where applicable)
	Exceeds Residential PSRG, Mig to GW PSRG and Non-Residential PSRG (and site-specific background for inorganics, where applicable)

Notes:

MG/KG - Milligram(s) per kilogram

1 - Constituents detected in historical surface soil samples. Field duplicates included in statistical summary.

2 - Site-specific background concentrations presented in Phase III RFI Report.

DL - background value is the detection limit

3 - NCDENR Inactive Hazardous Site Branch Preliminary Soils Remediation Goals (March 2015)

Value for chromium is trivalent chromium.

Value for benzo(g,h,i)perylene is pyrene

Value for mercury is mercuric chloride

Value for acenaphthylene is acenaphthene

Value for diphenyl ether is DuPont-derived value.

Value for phenanthrene is anthracene

	Exceeds PSRG for Protection of Migration to Groundwater (and site-specific background for inorganics, where applicable)
	Exceeds Residential PSRG (and site-specific background for inorganics, where applicable)
	Exceeds Residential PSRG and Mig to GW PSRG (and site-specific background for inorganics, where applicable)
	Exceeds Residential PSRG, Mig to GW PSRG and Non-Residential PSRG (and site-specific background for inorganics, where applicable)

						Date Sampled	08/30/1995	08/30/1995	08/30/1995	08/28/1995	08/28/1995	09/25/2008
						Start Depth - End Depth						26.5 - 28
						Sample Purpose	FS	FS	FS	FS	FS	FS
Silver	7440-22-4	MG/KG	78	1200	3.4	<0.905	<0.958	<0.933	<0.973	<0.949	<0.0793	
Thallium	7440-28-0	MG/KG	0.16	2.4	0.28						0.277 J	
Tin	7440-31-5	MG/KG	9400	100000	10000						2.82 B	
Vanadium	7440-62-2	MG/KG	78	1200	6 (22.8)						4.17	
Zinc	7440-66-6	MG/KG	4600	70000	1200						12.4	

Notes:

MG/KG - Milligram(s) per kilogram

1 - Constituents detected in historical subsurface soil samples. Field duplicates included in statistical summary.

2 - Site-specific background concentrations presented in Phase III RFI Report.

DL - background value is the detection limit

3 - NCDENR Inactive Hazardous Site Branch Preliminary Soils Remediation Goals (March 2015)

Value for chromium is trivalent chromium. Value for benzo(g,h,i)perylene is pyrene

Value for mercury is mercuric chloride Value for acenaphthylene is acenaphthene

Value for diphenyl ether is DuPont-derived value Value for phenanthrene is anthracene

	Exceeds PSRG for Protection of Mig to GW (and site-specific background for inorganics, where applicable)
	Exceeds Residential PSRG (and site-specific background for inorganics, where applicable)
	Exceeds Residential PSRG and Mig to GW PSRG (and site-specific background for inorganics, where applicable)
	Exceeds Residential PSRG, Mig to GW PSRG and Non-Residential PSRG (and site-specific background for inorganics, where applicable)

Notes:

MG/KG - Milligram(s) per kilogram

1 - Constituents detected in historical subsurface soil samples. Field duplicates included in statistical summary.

2 - Site-specific background concentrations presented in Phase III RFI Report.

DL - background value is the detection limit

3 - NCDENR Inactive Hazardous Site Branch Preliminary Soils Remediation Goals (March 2015)

Value for chromium is trivalent chromium. Value for benzo(g,h,i)perylene is pyrene

Value for mercury is mercuric chloride Value for acenaphthylene is acenaphthene

Value for diphenyl ether is DuPont-derived value Value for phenanthrene is anthracene

	Exceeds PSRG for Protection of Mig to GW (and site-specific background for inorganics, where applicable)
	Exceeds Residential PSRG (and site-specific background for inorganics, where applicable)
	Exceeds Residential PSRG and Mig to GW PSRG (and site-specific background for inorganics, where applicable)
	Exceeds Residential PSRG, Mig to GW PSRG and Non-Residential PSRG (and site-specific background for inorganics, where applicable)

Notes:

MG/KG - Milligram(s) per kilogram

1 - Constituents detected in historical subsurface soil samples. Field duplicates included in statistical summary.

2 - Site-specific background concentrations presented in Phase III RFI Report.

DL - background value is the detection limit

3 - NCDENR Inactive Hazardous Site Branch Preliminary Soils Remediation Goals (March 2015)

Value for chromium is trivalent chromium. Value for benzo(g,h,i)perylene is pyrene

Value for mercury is mercuric chloride Value for acenaphthylene is acenaphthene

Value for diphenyl ether is DuPont-derived value Value for phenanthrene is anthracene

	Exceeds PSRG for Protection of Mig to GW (and site-specific background for inorganics, where applicable)
	Exceeds Residential PSRG (and site-specific background for inorganics, where applicable)
	Exceeds Residential PSRG and Mig to GW PSRG (and site-specific background for inorganics, where applicable)
	Exceeds Residential PSRG, Mig to GW PSRG and Non-Residential PSRG (and site-specific background for inorganics, where applicable)

Notes:

MG/KG - Milligram(s) per kilogram

1 - Constituents detected in historical subsurface soil samples. Field duplicates included in statistical summary.

2 - Site-specific background concentrations presented in Phase III RFI Report.

DL - background value is the detection limit

3 - NCDENR Inactive Hazardous Site Branch Preliminary Soils Remediation Goals (March 2015)

Value for chromium is trivalent chromium. Value for benzo(g,h,i)perylene is pyrene

Value for mercury is mercuric chloride Value for acenaphthylene is acenaphthene

Value for diphenyl ether is DuPont-derived value Value for phenanthrene is anthracene

	Exceeds PSRG for Protection of Mig to GW (and site-specific background for inorganics, where applicable)
	Exceeds Residential PSRG (and site-specific background for inorganics, where applicable)
	Exceeds Residential PSRG and Mig to GW PSRG (and site-specific background for inorganics, where applicable)
	Exceeds Residential PSRG, Mig to GW PSRG and Non-Residential PSRG (and site-specific background for inorganics, where applicable)

Notes:

MG/KG - Milligram(s) per kilogram

1 - Constituents detected in historical subsurface soil samples. Field duplicates included in statistical summary.

2 - Site-specific background concentrations presented in Phase III RFI Report.

DL - background value is the detection limit

3 - NCDENR Inactive Hazardous Site Branch Preliminary Soils Remediation Goals (March 2015)

Value for chromium is trivalent chromium. Value for benzo(g,h,i)perylene is pyrene

Value for mercury is mercuric chloride Value for acenaphthylene is acenaphthene

Value for diphenyl ether is DuPont-derived value Value for phenanthrene is anthracene

	Exceeds PSRG for Protection of Mig to GW (and site-specific background for inorganics, where applicable)
	Exceeds Residential PSRG (and site-specific background for inorganics, where applicable)
	Exceeds Residential PSRG and Mig to GW PSRG (and site-specific background for inorganics, where applicable)
	Exceeds Residential PSRG, Mig to GW PSRG and Non-Residential PSRG (and site-specific background for inorganics, where applicable)

Notes:

MG/KG - Milligram(s) per kilogram

1 - Constituents detected in historical subsurface soil samples. Field duplicates included in statistical summary.

2 - Site-specific background concentrations presented in Phase III RFI Report.

DL - background value is the detection limit

3 - NCDENR Inactive Hazardous Site Branch Preliminary Soils Remediation Goals (March 2015)

Value for chromium is trivalent chromium. Value for benzo(g,h,i)perylene is pyrene

Value for mercury is mercuric chloride Value for acenaphthylene is acenaphthene

Value for diphenyl ether is DuPont-derived value Value for phenanthrene is anthracene

	Exceeds PSRG for Protection of Mig to GW (and site-specific background for inorganics, where applicable)
	Exceeds Residential PSRG (and site-specific background for inorganics, where applicable)
	Exceeds Residential PSRG and Mig to GW PSRG (and site-specific background for inorganics, where applicable)
	Exceeds Residential PSRG, Mig to GW PSRG and Non-Residential PSRG (and site-specific background for inorganics, where applicable)

Notes:

MG/KG - Milligram(s) per kilogram

1 - Constituents detected in historical subsurface soil samples. Field duplicates included in statistical summary.

2 - Site-specific background concentrations presented in Phase III RFI Report.

DL - background value is the detection limit

3 - NCDENR Inactive Hazardous Site Branch Preliminary Soils Remediation Goals (March 2015)

Value for chromium is trivalent chromium. Value for benzo(g,h,i)perylene is pyrene

Value for mercury is mercuric chloride Value for acenaphthylene is acenaphthene

Value for diphenyl ether is DuPont-derived value Value for phenanthrene is anthracene

	Exceeds PSRG for Protection of Mig to GW (and site-specific background for inorganics, where applicable)
	Exceeds Residential PSRG (and site-specific background for inorganics, where applicable)
	Exceeds Residential PSRG and Mig to GW PSRG (and site-specific background for inorganics, where applicable)
	Exceeds Residential PSRG, Mig to GW PSRG and Non-Residential PSRG (and site-specific background for inorganics, where applicable)

Notes:

MG/KG - Milligram(s) per kilogram

1 - Constituents detected in historical subsurface soil samples. Field duplicates included in statistical summary.

2 - Site-specific background concentrations presented in Phase III RFI Report.

DL - background value is the detection limit

3 - NCDENR Inactive Hazardous Site Branch Preliminary Soils Remediation Goals (March 2015)

Value for chromium is trivalent chromium. Value for benzo(g,h,i)perylene is pyrene

Value for mercury is mercuric chloride Value for acenaphthylene is acenaphthene

Value for diphenyl ether is DuPont-derived value Value for phenanthrene is anthracene

	Exceeds PSRG for Protection of Mig to GW (and site-specific background for inorganics, where applicable)
	Exceeds Residential PSRG (and site-specific background for inorganics, where applicable)
	Exceeds Residential PSRG and Mig to GW PSRG (and site-specific background for inorganics, where applicable)
	Exceeds Residential PSRG, Mig to GW PSRG and Non-Residential PSRG (and site-specific background for inorganics, where applicable)

Notes:

MG/KG - Milligram(s) per kilogram

1 - Constituents detected in historical subsurface soil samples. Field duplicates included in statistical summary.

2 - Site-specific background concentrations presented in Phase III RFI Report.

DL - background value is the detection limit

3 - NCDENR Inactive Hazardous Site Branch Preliminary Soils Remediation Goals (March 2015)

Value for chromium is trivalent chromium. Value for benzo(g,h,i)perylene is pyrene

Value for mercury is mercuric chloride Value for acenaphthylene is acenaphthene

Value for diphenyl ether is DuPont-derived value Value for phenanthrene is anthracene

	Exceeds PSRG for Protection of Mig to GW (and site-specific background for inorganics, where applicable)
	Exceeds Residential PSRG (and site-specific background for inorganics, where applicable)
	Exceeds Residential PSRG and Mig to GW PSRG (and site-specific background for inorganics, where applicable)
	Exceeds Residential PSRG, Mig to GW PSRG and Non-Residential PSRG (and site-specific background for inorganics, where applicable)

Notes:

MG/KG - Milligram(s) per kilogram

1 - Constituents detected in historical subsurface soil samples. Field duplicates included in statistical summary.

2 - Site-specific background concentrations presented in Phase III RFI Report.

DL - background value is the detection limit

3 - NCDENR Inactive Hazardous Site Branch Preliminary Soils Remediation Goals (March 2015)

Value for chromium is trivalent chromium. Value for benzo(g,h,i)perylene is pyrene

Value for mercury is mercuric chloride Value for acenaphthylene is acenaphthene

Value for diphenyl ether is DuPont-derived value Value for phenanthrene is anthracene

	Exceeds PSRG for Protection of Mig to GW (and site-specific background for inorganics, where applicable)
	Exceeds Residential PSRG (and site-specific background for inorganics, where applicable)
	Exceeds Residential PSRG and Mig to GW PSRG (and site-specific background for inorganics, where applicable)
	Exceeds Residential PSRG, Mig to GW PSRG and Non-Residential PSRG (and site-specific background for inorganics, where applicable)

Notes:

MG/KG - Milligram(s) per kilogram

1 - Constituents detected in historical subsurface soil samples. Field duplicates included in statistical summary.

2 - Site-specific background concentrations presented in Phase III RFI Report.

DL - background value is the detection limit

3 - NCDENR Inactive Hazardous Site Branch Preliminary Soils Remediation Goals (March 2015)

Value for chromium is trivalent chromium. Value for benzo(g,h,i)perylene is pyrene

Value for mercury is mercuric chloride Value for acenaphthylene is acenaphthene

Value for diphenyl ether is DuPont-derived value Value for phenanthrene is anthracene

	Exceeds PSRG for Protection of Mig to GW (and site-specific background for inorganics, where applicable)
	Exceeds Residential PSRG (and site-specific background for inorganics, where applicable)
	Exceeds Residential PSRG and Mig to GW PSRG (and site-specific background for inorganics, where applicable)
	Exceeds Residential PSRG, Mig to GW PSRG and Non-Residential PSRG (and site-specific background for inorganics, where applicable)

Notes:

MG/KG - Milligram(s) per kilogram

1 - Constituents detected in historical subsurface soil samples. Field duplicates included in statistical summary.

2 - Site-specific background concentrations presented in Phase III RFI Report.

DL - background value is the detection limit

3 - NCDENR Inactive Hazardous Site Branch Preliminary Soils Remediation Goals (March 2015)

Value for chromium is trivalent chromium. Value for benzo(g,h,i)perylene is pyrene

Value for mercury is mercuric chloride Value for acenaphthylene is acenaphthene

Value for diphenyl ether is DuPont-derived value Value for phenanthrene is anthracene

	Exceeds PSRG for Protection of Mig to GW (and site-specific background for inorganics, where applicable)
	Exceeds Residential PSRG (and site-specific background for inorganics, where applicable)
	Exceeds Residential PSRG and Mig to GW PSRG (and site-specific background for inorganics, where applicable)
	Exceeds Residential PSRG, Mig to GW PSRG and Non-Residential PSRG (and site-specific background for inorganics, where applicable)

Notes:

MG/KG - Milligram(s) per kilogram

1 - Constituents detected in historical subsurface soil samples. Field duplicates included in statistical summary.

2 - Site-specific background concentrations presented in Phase III RFI Report.

DL - background value is the detection limit

3 - NCDENR Inactive Hazardous Site Branch Preliminary Soils Remediation Goals (March 2015)

Value for chromium is trivalent chromium. Value for benzo(g,h,i)perylene is pyrene

Value for mercury is mercuric chloride Value for acenaphthylene is acenaphthene

Value for diphenyl ether is DuPont-derived value Value for phenanthrene is anthracene

	Exceeds PSRG for Protection of Mig to GW (and site-specific background for inorganics, where applicable)
	Exceeds Residential PSRG (and site-specific background for inorganics, where applicable)
	Exceeds Residential PSRG and Mig to GW PSRG (and site-specific background for inorganics, where applicable)
	Exceeds Residential PSRG, Mig to GW PSRG and Non-Residential PSRG (and site-specific background for inorganics, where applicable)

Notes:

MG/KG - Milligram(s) per kilogram

1 - Constituents detected in historical subsurface soil samples. Field duplicates included in statistical summary.

2 - Site-specific background concentrations presented in Phase III RFI Report.

DL - background value is the detection limit

3 - NCDENR Inactive Hazardous Site Branch Preliminary Soils Remediation Goals (March 2015)

Value for chromium is trivalent chromium. Value for benzo(g,h,i)perylene is pyrene

Value for mercury is mercuric chloride Value for acenaphthylene is acenaphthene

Value for diphenyl ether is DuPont-derived value Value for phenanthrene is anthracene

	Exceeds PSRG for Protection of Mig to GW (and site-specific background for inorganics, where applicable)
	Exceeds Residential PSRG (and site-specific background for inorganics, where applicable)
	Exceeds Residential PSRG and Mig to GW PSRG (and site-specific background for inorganics, where applicable)
	Exceeds Residential PSRG, Mig to GW PSRG and Non-Residential PSRG (and site-specific background for inorganics, where applicable)

Notes:

MG/KG - Milligram(s) per kilogram

1 - Constituents detected in historical subsurface soil samples. Field duplicates included in statistical summary.

2 - Site-specific background concentrations presented in Phase III RFI Report.

DL - background value is the detection limit

3 - NCDENR Inactive Hazardous Site Branch Preliminary Soils Remediation Goals (March 2015)

Value for chromium is trivalent chromium. Value for benzo(g,h,i)perylene is pyrene

Value for mercury is mercuric chloride Value for acenaphthylene is acenaphthene

Value for diphenyl ether is DuPont-derived value Value for phenanthrene is anthracene

	Exceeds PSRG for Protection of Mig to GW (and site-specific background for inorganics, where applicable)
	Exceeds Residential PSRG (and site-specific background for inorganics, where applicable)
	Exceeds Residential PSRG and Mig to GW PSRG (and site-specific background for inorganics, where applicable)
	Exceeds Residential PSRG, Mig to GW PSRG and Non-Residential PSRG (and site-specific background for inorganics, where applicable)

3 - NCDENR Inactive Hazardous Site Branch Preliminary Soils Remediation Goals (March 2015)

Value for chromium is trivalent chromium. Value for benzo(g,h,i)perylene is pyrene

Value for mercury is mercuric chloride Value for acenaphthylene is acenaphthene

Value for diphenyl ether is DuPont-derived value Value for phenanthrene is anthracene

	Exceeds PSRG for Protection of Mig to GW (and site-specific background for inorganics, where applicable)
	Exceeds Residential PSRG (and site-specific background for inorganics, where applicable)
	Exceeds Residential PSRG and Mig to GW PSRG (and site-specific background for inorganics, where applicable)
	Exceeds Residential PSRG, Mig to GW PSRG and Non-Residential PSRG (and site-specific background for inorganics, where applicable)

Notes:

MG/KG - Milligram(s) per kilogram

1 - Constituents detected in historical subsurface soil samples. Field duplicates included in statistical summary.

2 - Site-specific background concentrations presented in Phase III RFI Report.

DL - background value is the detection limit

3 - NCDENR Inactive Hazardous Site Branch Preliminary Soils Remediation Goals (March 2015)

Value for chromium is trivalent chromium. Value for benzo(g,h,i)perylene is pyrene

Value for mercury is mercuric chloride Value for acenaphthylene is acenaphthene

Value for diphenyl ether is DuPont-derived value Value for phenanthrene is anthracene

	Exceeds PSRG for Protection of Mig to GW (and site-specific background for inorganics, where applicable)
	Exceeds Residential PSRG (and site-specific background for inorganics, where applicable)
	Exceeds Residential PSRG and Mig to GW PSRG (and site-specific background for inorganics, where applicable)
	Exceeds Residential PSRG, Mig to GW PSRG and Non-Residential PSRG (and site-specific background for inorganics, where applicable)

Notes:

MG/KG - Milligram(s) per kilogram

1 - Constituents detected in 2014 surface soil samples. Field duplicates included in statistical summary.

2 - Site-specific background concentrations presented in Phase III RFI Report.

DL - background value is the detection limit

3 - NCDENR Inactive Hazardous Site Branch Preliminary Soils Remediation Goals (March 2015)

Value for chromium is trivalent chromium.

Value for mercury is mercuric chloride

Value for diphenyl ether is DuPont-derived value.

Indicates exceedance of a screening level and site-specific background (for inorganics).

Notes:

MG/KG - Milligram(s) per kilogram

1 - Constituents detected in 2014 surface soil samples. Field duplicates included in statistical summary.

2 - Site-specific background concentrations presented in Phase III RFI Report.

DL - background value is the detection limit

3 - NCDENR Inactive Hazardous Site Branch Preliminary Soils Remediation Goals (March 2015)

Value for chromium is trivalent chromium.

Value for mercury is mercuric chloride

Value for diphenyl ether is DuPont-derived value.

Indicates exceedance of a screening level and site-specific background (for inorganics).

Notes:

MG/KG - Milligram(s) per kilogram

1 - Constituents detected in 2014 surface soil samples. Field duplicates included in statistical summary.

2 - Site-specific background concentrations presented in Phase III RFI Report.

DL - background value is the detection limit

3 - NCDENR Inactive Hazardous Site Branch Preliminary Soils Remediation Goals (March 2015)

Value for chromium is trivalent chromium.

Value for mercury is mercuric chloride

Value for diphenyl ether is DuPont-derived value.

Indicates exceedance of a screening level and site-specific background (for inorganics).

Notes:

MG/KG - Milligram(s) per kilogram

1 - Constituents detected in 2014 surface soil samples. Field duplicates included in statistical summary.

2 - Site-specific background concentrations presented in Phase III RFI Report.

DL - background value is the detection limit

3 - NCDENR Inactive Hazardous Site Branch Preliminary Soils Remediation Goals (March 2015)

Value for chromium is trivalent chromium.

Value for mercury is mercuric chloride

Value for diphenyl ether is DuPont-derived value.

Indicates exceedance of a screening level and site-specific background (for inorganics).

Notes:

MG/KG - Milligram(s) per kilogram

1 - Constituents detected in 2014 surface soil samples. Field duplicates included in statistical summary.

2 - Site-specific background concentrations presented in Phase III RFI Report.

DL - background value is the detection limit

3 - NCDENR Inactive Hazardous Site Branch Preliminary Soils Remediation Goals (March 2015)

Value for chromium is trivalent chromium.

Value for mercury is mercuric chloride

Value for diphenyl ether is DuPont-derived value.

Indicates exceedance of a screening level and site-specific background (for inorganics).

Notes:

MG/KG - Milligram(s) per kilogram

1 - Constituents detected in 2014 surface soil samples. Field duplicates included in statistical summary.

2 - Site-specific background concentrations presented in Phase III RFI Report.

DL - background value is the detection limit

3 - NCDENR Inactive Hazardous Site Branch Preliminary Soils Remediation Goals (March 2015)

Value for chromium is trivalent chromium.

Value for mercury is mercuric chloride

Value for diphenyl ether is DuPont-derived value.

Indicates exceedance of a screening level and site-specific background (for inorganics).

Notes:

MG/KG - Milligram(s) per kilogram

1 - Constituents detected in 2014 surface soil samples. Field duplicates included in statistical summary.

2 - Site-specific background concentrations presented in Phase III RFI Report.

DL - background value is the detection limit

3 - NCDENR Inactive Hazardous Site Branch Preliminary Soils Remediation Goals (March 2015)

Value for chromium is trivalent chromium.

Value for mercury is mercuric chloride

Value for diphenyl ether is DuPont-derived value.

Indicates exceedance of a screening level and site-specific background (for inorganics).

Notes:

UG/L - Microgram(s) per liter

1 - Constituents detected in surficial aquifer monitoring wells during RFI and CAMU sampling between 2014 and 2015.

Field duplicates included in statistical summary.

2 - Sources of screening criteria:

NC 2L - North Carolina 2L Drinking Water Standard 15A NCAC 2L (April 2013)

NC IMAC - North Carolina Interim Maximum Allowable Concentration (April 2013)

3 - COPC Notes

LFD - Low frequency of detection (<5%) and not a site-related constituents or breakdown product of a site-related constituent

Indicates exceedance of a screening level.

Notes:

UG/L - Microgram(s) per liter

1 - Constituents detected in surficial aquifer monitoring wells during RFI and CAMU sampling between 2014 and 2015. Field duplicates included in statistical summary.

2 - Sources of screening criteria:

NC 2L - North Carolina 2L Drinking Water Standard 15A NCAC 2L (April 2013)

NC IMAC - North Carolina Interim Maximum Allowable Concentration (April 2013)

3 - COPC Notes

LFD - Low frequency of detection (<5%) and not a site-related constituents or breakdown product of a site-related constituent

Indicates exceedance of a screening level.

Notes:

UG/L - Microgram(s) per liter

1 - Constituents detected in surficial aquifer monitoring wells during RFI and CAMU sampling between 2014 and 2015. Field duplicates included in statistical summary.

2 - Sources of screening criteria:

NC 2L - North Carolina 2L Drinking Water Standard 15A NCAC 2L (April 2013)

NC IMAC - North Carolina Interim Maximum Allowable Concentration (April 2013)

3 - COPC Notes

LFD - Low frequency of detection (<5%) and not a site-related constituents or breakdown product of a site-related constituent

Indicates exceedance of a screening level.

Notes:

UG/L - Microgram(s) per liter

1 - Constituents detected in surficial aquifer monitoring wells during RFI and CAMU sampling between 2014 and 2015. Field duplicates included in statistical summary.

2 - Sources of screening criteria:

NC 2L - North Carolina 2L Drinking Water Standard 15A NCAC 2L (April 2013)

NC IMAC - North Carolina Interim Maximum Allowable Concentration (April 2013)

3 - COPC Notes

LFD - Low frequency of detection (<5%) and not a site-related constituents or breakdown product of a site-related constituent

Indicates exceedance of a screening level.

1 - Constituents detected in surficial aquifer monitoring wells during RFI and CAMU sampling between 2014 and 2015. Field duplicates included in statistical summary.

2 - Sources of screening criteria:

NC 2L - North Carolina 2L Drinking Water Standard 15A NCAC 2L (April 2013)

NC IMAC - North Carolina Interim Maximum Allowable Concentration (April 2013)

3 - COPC Notes

LFD - Low frequency of detection (<5%) and not a site-related constituents or breakdown product of a site-related constituent

Indicates exceedance of a screening level.

Notes:

UG/L - Microgram(s) per liter

1 - Constituents detected in surficial aquifer monitoring wells during RFI and CAMU sampling between 2014 and 2015. Field duplicates included in statistical summary.

2 - Sources of screening criteria:

NC 2L - North Carolina 2L Drinking Water Standard 15A NCAC 2L (April 2013)

NC IMAC - North Carolina Interim Maximum Allowable Concentration (April 2013)

3 - COPC Notes

LFD - Low frequency of detection (<5%) and not a site-related constituents or breakdown product of a site-related constituent

Indicates exceedance of a screening level.

Notes:

Sources of screening criteria:

NC 2L - North Carolina 2L Drinking Water Standard 15A NCAC 2L (April 2013)

NC IMAC - North Carolina Interim Maximum Allowable Concentration (April 2013)

Indicates exceedance of a screening level.

Notes:

UG/L - Microgram(s) per liter

1 - Volatile constituents detected in surficial aquifer monitoring wells during RFI and CAMU sampling between 2014 and 2015. Field duplicates included in statistical summary.

2 - Sources of screening criteria:

NC GWSL - NC DWM Vapor Intrusion Screening Levels Groundwater Screening Levels (GWSLs) (June 2014)

Indicates exceedance of a screening level.

Notes:

UG/L - Microgram(s) per liter

1 - Volatile constituents detected in surficial aquifer monitoring wells during RFI and CAMU sampling between 2014 and 2015. Field duplicates included in statistical summary.

2 - Sources of screening criteria:

NC GWSL - NC DWM Vapor Intrusion Screening Levels Groundwater Screening Levels (GWSLs) (June 2014)

Indicates exceedance of a screening level.

Notes:

UG/L - Microgram(s) per liter

1 - Volatile constituents detected in surficial aquifer monitoring wells during RFI and CAMU sampling between 2014 and 2015. Field duplicates included in statistical summary.

2 - Sources of screening criteria:

NC GWSL - NC DWM Vapor Intrusion Screening Levels Groundwater Screening Levels (GWSLs) (June 2014)

Indicates exceedance of a screening level.

Notes:

UG/L - Microgram(s) per liter

1 - Volatile constituents detected in surficial aquifer monitoring wells during RFI and CAMU sampling between 2014 and 2015. Field duplicates included in statistical summary.

2 - Sources of screening criteria:

NC GWSL - NC DWM Vapor Intrusion Screening Levels Groundwater Screening Levels (GWSLs) (June 2014)

Indicates exceedance of a screening level.

Notes:

UG/L - Microgram(s) per liter

1 - Volatile constituents detected in surficial aquifer monitoring wells during RFI and CAMU sampling between 2014 and 2015. Field duplicates included in statistical summary.

2 - Sources of screening criteria:

NC GWSL - NC DWM Vapor Intrusion Screening Levels Groundwater Screening Levels (GWSLs) (June 2014)

Indicates exceedance of a screening level.

Notes:

UG/L - Microgram(s) per liter

1 - Volatile constituents detected in surficial aquifer monitoring wells during RFI and CAMU sampling between 2014 and 2015. Field duplicates included in statistical summary.

2 - Sources of screening criteria:

NC GWSL - NC DWM Vapor Intrusion Screening Levels Groundwater Screening Levels (GWSLs) (June 2014)

Indicates exceedance of a screening level.

Notes:

UG/L - Microgram(s) per liter

1 - Volatile constituents detected in surficial aquifer monitoring wells during RFI and CAMU sampling between 2014 and 2015. Field duplicates included in statistical summary.

2 - Sources of screening criteria:

NC GWSL - NC DWM Vapor Intrusion Screening Levels Groundwater Screening Levels (GWSLs) (June 2014)

Indicates exceedance of a screening level.

Notes:

µg/L, microgram per liter; mg/L, milligram per liter; ESV, Ecological screening value; VOCs, Volatile organic compounds

^a - Minimum of detected values

^b - Maximum of detected values

^c - Arithmetic mean of all data. Half of method detection limit used for non-detects.

^d - Sources used are as follows;

- NC2B Standards (NCDENR, 2007)

- EPA R3 BTAG, USEPA Region III Biological Technical Assistance Group (EPA, 2006)

- EPA R5 ESL, USEPA Region V Ecological Screening Levels (EPA, 2003)

- EPA R6 FW, Region 6 Fresh water (TNRCC, 2001)

- Tier II SCV, Secondary Chronic Value (Suter and Tsao, 1996)

- Canadian WQG, Canadian Water Quality Guidelines (CCME, 2013)

- EPA R4 ESV, USEPA Region IV Environmental Screening Value (EPA, 2001)

- OSWER Tier II SCV (EPA, 1996)

- NAWQC Chronic, National Ambient Water Quality Criteria Chronic levels (EPA, 2012)

- CCID, Chemical Classification and Information Database (LeBlanc, 1980)

- TCEQ, Texas Commission of Environmental Quality (TCEQ, 2014)

- DuPont-derived effects threshold concentration (ETC) based on the mean of the no observed effect concentration (NOEC) and the lowest observed effect concentrations (LOEC).

Yellow - COPECS identified based on Max > ESV

Notes:

µg/L, microgram per liter; ESV, Ecological screening value; (S)VOCs, (Semi-) Volatile organic compounds

^a - Minimum of detected values

^b - Maximum of detected values

^c - Arithmetic mean of all data. Half of method detection limit used for non-detects.

^d - Sources used are as follows;

- NC2B Standards (NCDENR 2007)

- EPA R3 BTAG, USEPA Region III Biological Technical Assistance Group (EPA 2006)

- EPA R5 ESL, USEPA Region V Ecological Screening Levels (EPA 2003)

- EPA R6 FW, Region 6 Fresh water (TNRCC 2001)

- Tier II SCV, Secondary Chronic Value (Suter and Tsao 1996)

- Canadian WQG, Canadian Water Quality Guidelines (CCME 2013)

- EPA R4 ESV, USEPA Region IV Environmental Screening Value (EPA 2001)

- OSWER Tier II SCV (EPA 1996)

- NAWQC Chronic, National Ambient Water Quality Criteria Chronic levels (EPA 2012)

Green - COPEC identified based on detects and No ESV, but ultimate not retained as a COPEC based limited detection.

Notes:

MG/KG - Milligram(s) per kilogram

1 - Constituents detected in 2014 sediment samples. Field duplicates included in statistical summary.

2 - NCDENR Inactive Hazardous Site Branch Preliminary Soils Remediation Goals (March 2015)

Value for chromium is trivalent chromium.

Value for benzo(g,h,i)perylene is pyrene

Value for mercury is mercuric chloride

Value for acenaphthylene is acenaphthene

Value for diphenyl ether is DuPont-derived value.

Value for phenanthrene is anthracene

 Exceeds Residential PSRG (and site-specific background for inorganics, where applicable)

3 - Site-specific recreational screening levels provided in Appendix D.

Notes:

MG/KG - Milligram(s) per kilogram

1 - Constituents detected in 2014 sediment samples. Field duplicates included in statistical summary.

2 - NCDENR Inactive Hazardous Site Branch Preliminary Soils Remediation Goals (March 2015)

Value for chromium is trivalent chromium. Value for benzo(g,h,i)perylene is pyrene

Value for mercury is mercuric chloride Value for acenaphthylene is acenaphthene

Value for diphenyl ether is DuPont-derived value. Value for phenanthrene is anthracene

 Exceeds Residential PSRG (and site-specific background for inorganics, where applicable)

3 - Site-specific recreational screening levels provided in Appendix D.

Constituents of Potential Concern in Sediment
Remedial Investigation Report
Former DuPont Brevard Facility
Cedar Mountain, NC

Analyte	CAS No.	Units	NC PSRG - Residential	Site-Specific Screening Level	Location ID	SED-BALLFIELD
					Field Sample ID	SSP14-SED-BALLFIELD
					Date Sampled	10/23/2014
					Sample Purpose	FS
Iron	7439-89-6	MG/KG	11000	177000		6090 J
Lead	7439-92-1	MG/KG	400			2.87 J
Manganese	7439-96-5	MG/KG	360	6000		106 J
Mercury	7439-97-6	MG/KG	1.9			<0.0113
Nickel	7440-02-0	MG/KG	300			0.453 J
Selenium	7782-49-2	MG/KG	78			0.126 J
Silver	7440-22-4	MG/KG	78			<0.221
Thallium	7440-28-0	MG/KG	0.16	2.53		0.114 J
Tin	7440-31-5	MG/KG	9400			1.72 B
Vanadium	7440-62-2	MG/KG	78			7.51 J
Zinc	7440-66-6	MG/KG	4600			11.8

Notes:

MG/KG - Milligram(s) per kilogram

1 - Constituents detected in 2014 sediment samples. Field duplicates included in statistical summary.

2 - NCDENR Inactive Hazardous Site Branch Preliminary Soils Remediation Goals (March 2015)

Value for chromium is trivalent chromium. Value for benzo(g,h,i)perylene is pyrene

Value for mercury is mercuric chloride Value for acenaphthylene is acenaphthene

Value for diphenyl ether is DuPont-derived value. Value for phenanthrene is anthracene

 Exceeds Residential PSRG (and site-specific background for inorganics, where applicable)

3 - Site-specific recreational screening levels provided in Appendix D.

Notes:

µg/kg, microgram per kilogram; mg/kg, milligram per kilogram; ESV, Ecological screening value; (S)VOCs, (Semi-)Volatile organic compounds

^a - Minimum of detected values

^b - Maximum of detected values

^c - Arithmetic mean of all data. Half of method detection limit used for non-detects.

^d - Sources used are as follows;

- EPA R5 ESL, EPA Region 5 Ecological Screening Levels (USEPA, 2003a)

- EPA R4 ESV, EPA Region IV Ecological Screening Values (USEPA, 1995)

- EPA R3 BTAG, EPA Region III Biological Technical Assistance Group Freshwater Sediment Screening Benchmarks (EPA, 2006a)

- TX SQG, Texas Sediment Quality Guidelines (TNRCC, 2001)

- Dutch IV (Buchman, 2008)

- TEL, Threshold effects level (Buchman 2008)

- AET Marine, Apparent effects threshold (Buchman, 2008)

- Washington MAEL, Washington Minor Adverse Effect Level (WDE, 2001)

Yellow - COPECS identified based on Max > ESV

Green - COPECS identified based on detects and No ESV

^e - Evaluated as a mixture [Total Polycyclic Aromatic Hydrocarbons (PAHs)]

Table 24

^c - Arithmetic mean of all data. Half of method detection limit used for non-detects.

^d - Sources used are as follows;

- EPA R4 ESV, EPA Region IV Ecological Screening Values (EPA 2001)

- EPA R3 BTAG, EPA Region III Biological Technical Assistance Group Freshwater Sediment Screening Benchmarks (EPA 2006)

- TEL, Threshold effects level (Buchman 2008)

- TCEQ, Texas Commission for Environmental Quality (TCEQ 2014)

* - Alternate ESVs identified for Step 2 Refinement

- HQ_{MEAN} = Mean Detected Concentration/ESV

COPC = Constituent of Potential Concern

ACL = Alternate Concentration Limit

ND = Not detected

Notes:

1 - Constituents identified as COPCs for ACL derivation (URS, 2014). Aquifer designation shown based on historic screening presented in URS, 2014.

2 - Proposed ACL is the limiting water quality criterion with an applied attenuation factor of 500; with the exception of values in excess of solubility, which are set at the solubility limit.

3 - Site-wide maximum detected concentration during 2014-2015 monitoring events.

4 - Surficial and bedrock aquifer perimeter monitoring wells (BR-1, BR-3, BR-5, BR-9, BR-11, MW104A/B, MW105, MW106A/B, MW107A/B, MW108, MW111A/B, MW112A/B, MW207A/B, MW210A/B, MW213, MW214, MW215, MW301A/B, MW302A/B, R87-S8, R87-S9 and R87-S10) .

Notes:

mg/kg³ - milligram(s) per kilogram, RL - reporting limit

1 - COPCs identified in Table 11.

2 - RL for Protection of Migration to Groundwater (URS, 2014)

3 - Detects in surface, subsurface soil and waste material above RLs. SWMU 17 data excluded from the evaluation.

4 - Distance measured from unit to Little River. With exception of SWMU 18, groundwater flows from these units towards Little River. SWMU 18 is cross-gradient to DERA Creek.

5 - Groundwater comparison detailed in Table 26.

6 - Pore water data provided in Table 20.

7 - Surface water data provided in Table 17.

J-Analyte present. Reported value may not be accurate or precise.

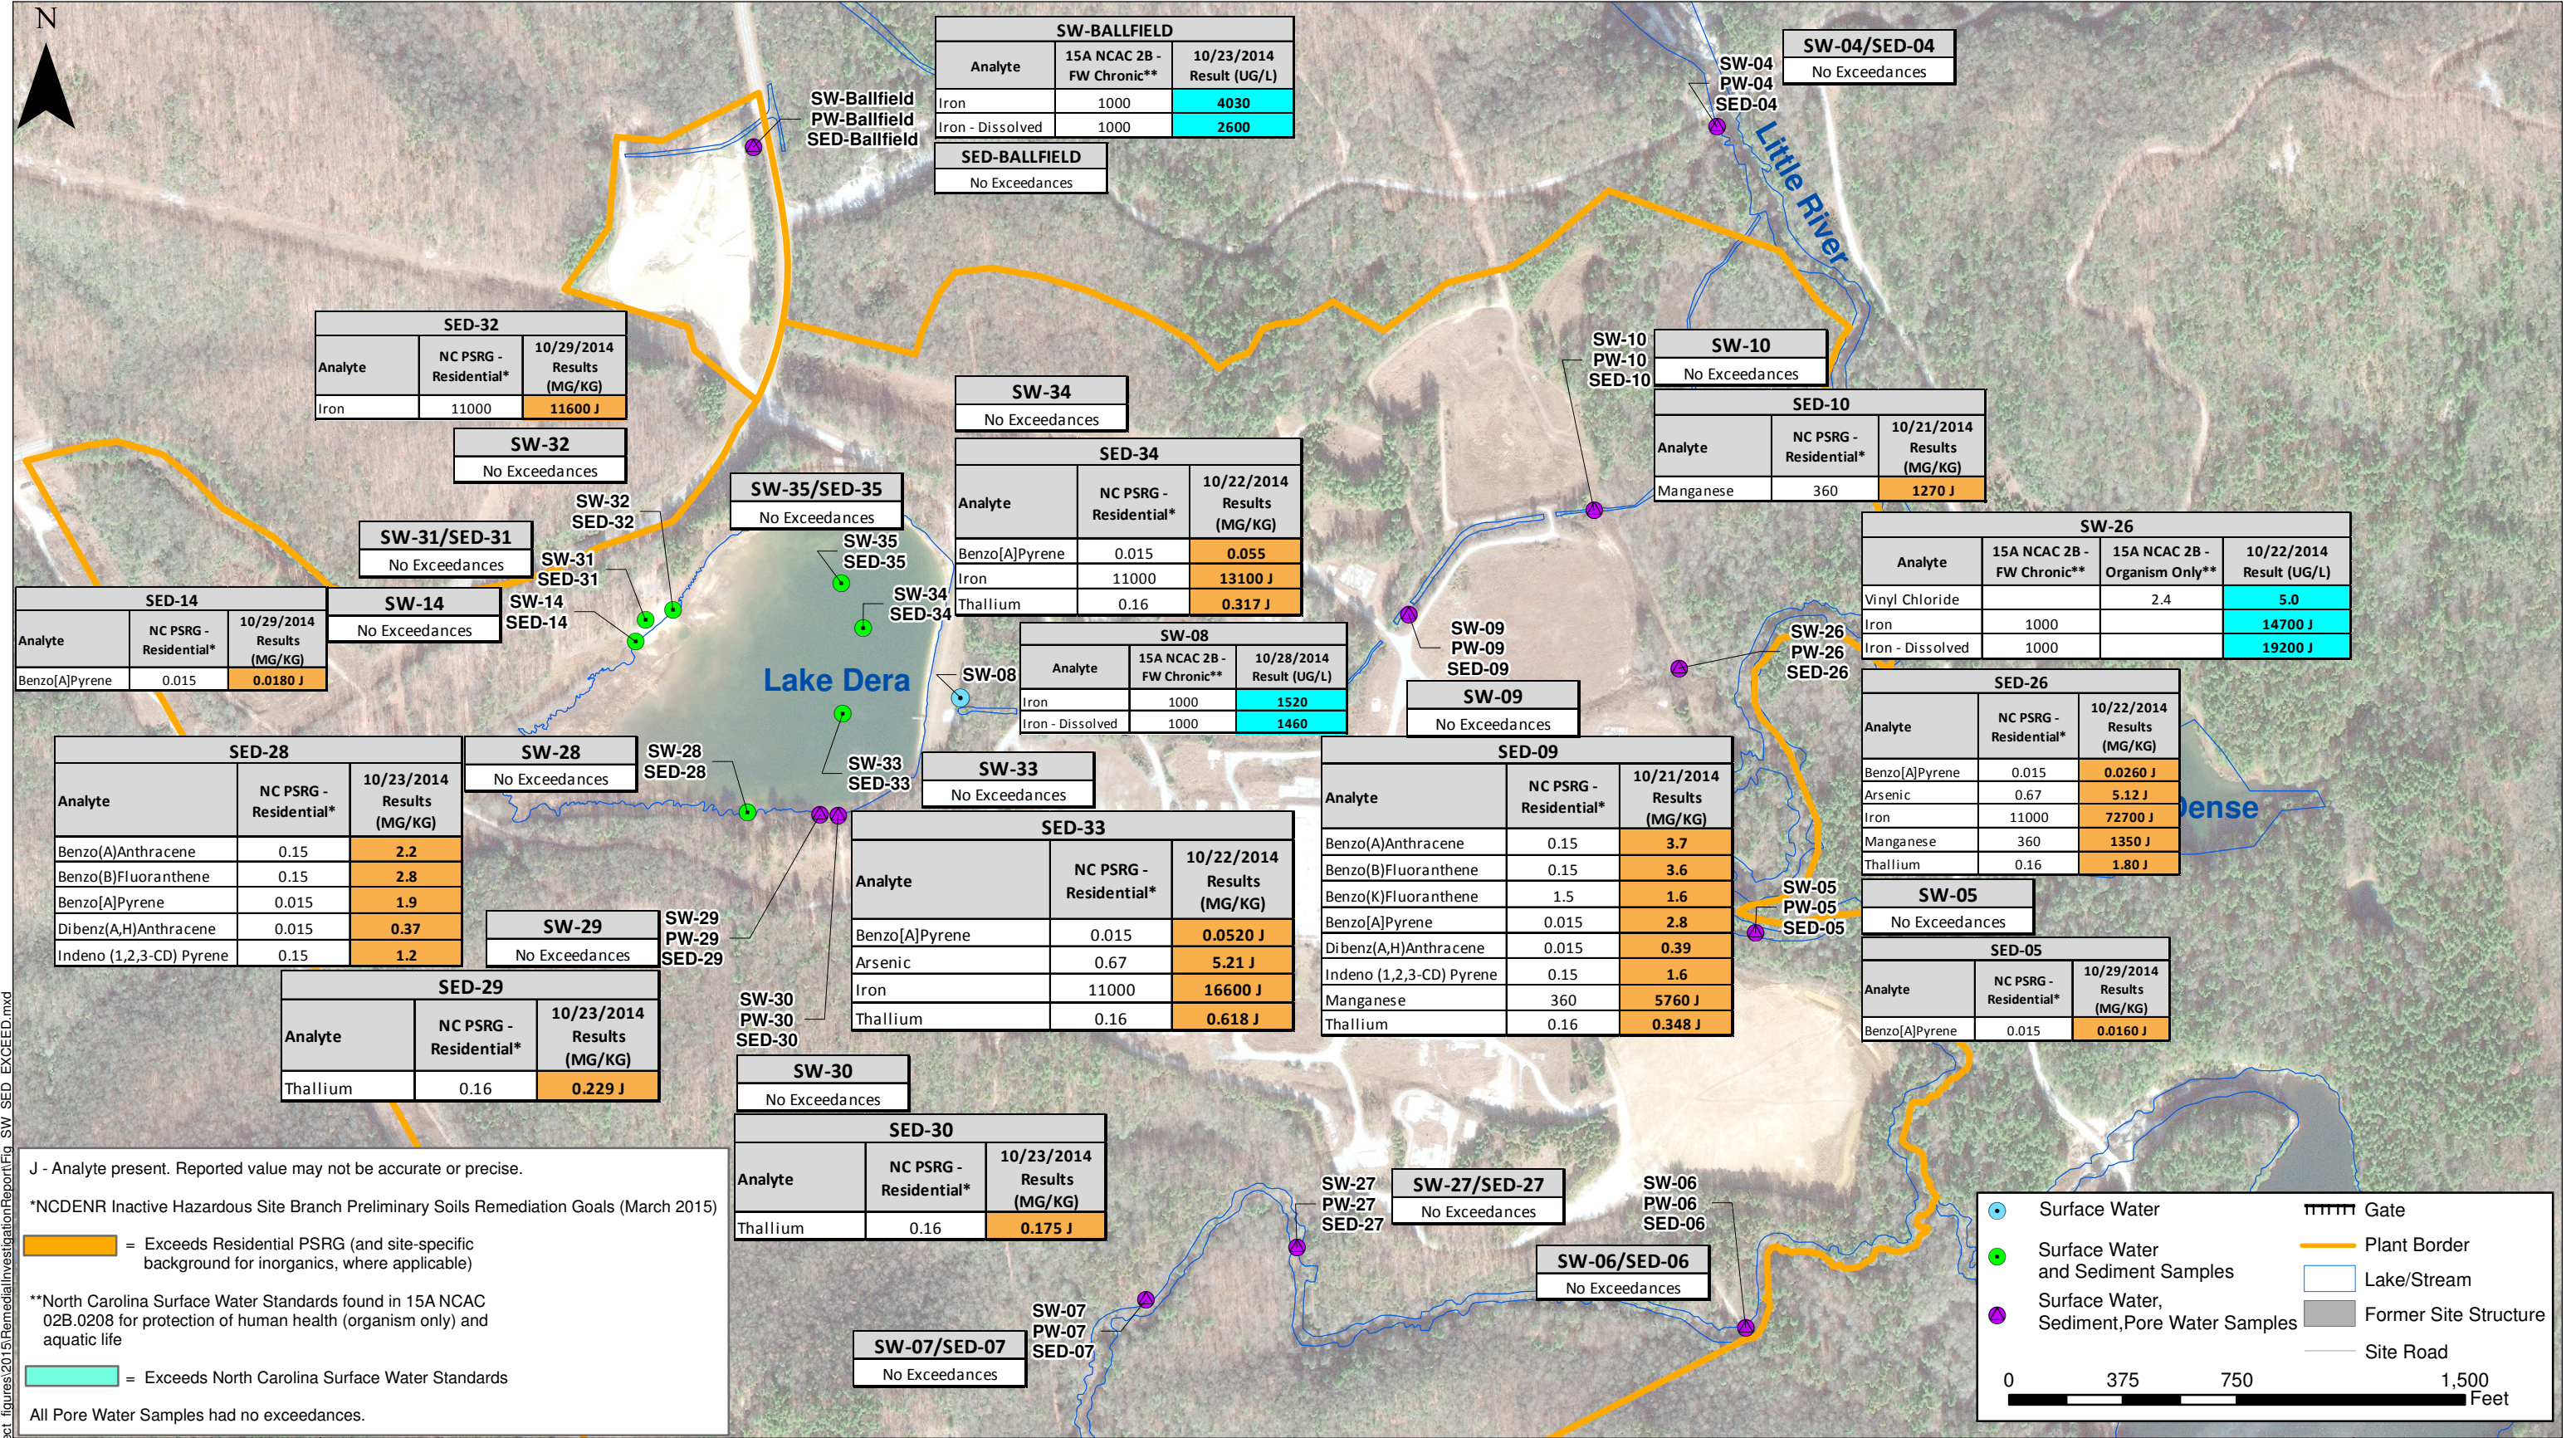

Sources of screening criteria:
 NC 2L - North Carolina 2L Drinking Water Standard 15A NCAC 2L (April 2013)
 NC IMAC - North Carolina Interim Maximum Allowable Concentration (April 2013)

Well locations with no data boxes did not have exceedances.

Results in UG/L.

=Indicates exceedance of a screening level.

SAMPLE ID	DATE SAMPLED	TIME SAMPLED	PID READING	SOIL DESCRIPTION	DEPTH INTERVAL SAMPLED (Inches)
MA-SS-1	12/2/2014	1104	NR	0" - 6" Light tan sandy silt, trace roots, moist, very fine sandy silt	6" - 18"
				6" - 11" Light gray damp, fine grained sand with cemented fragments	
				11" - 24" Very light tan mixed with dark tan fine grain sand, little silt, damp	
MA-SS-2	12/2/2014	1432	0.2	0" - 6" Light tan micaceous silty sand, fine, slightly damp with organic (grass leaves)	6" - 18"
				6" - 24" Light tan silty sand with some rock fragments throughout, brick fragment 16" bls, slightly moist	
MA-SS-3	12/3/2014	1033	0.0	0" - 10" bls tan fine silty sand with roots and grass throughout, small pebble, moist	6" - 18"
				12" - 16" bls light gray fine sandy silt, slightly damp	
				16" - 17" bls tan with orange mottling, fine sandy silt, slightly damp	
				17" bls wood encountered	
				17" - 18.5" bls asphalt	
MA-SS-4	12/2/2014	1544	0.7	0" - 6" Brown fine silty sand, with organics (roots and grass), slightly damp 7" - 19" bls encounter large pieces of cement	6" - 18"
				6" - 13" Brown fine silty sand with asphalt, cement , slightly damp. In In a hand augur boring at about 12" bls a small blue piece of PET and a black plastic conduit fitting were encountered as well as large pieces of cement from 7" - 19"	
				13" to 19" Greyish brown fine silty sand with some gravel, slightly damp	
				7" - 19" bls a large pieces of cement were encountered	
				19" - 24" Tan fine silty sand with few medium grains and with little gravel, slightly damp	
MA-SS-5	12/3/2014	1104	0.0	0" - 3" bls Dark brown sandy silt, fine grain, grass root, slightly damp	6" - 18"
				3" - 14" bls Tan fine gray silty sand with few gravel throughout, slightly damp	
				6" - 8" collected non native items from boring and the onsite resource described them as metallic debris and possible metal strap or old can	
				14" - 23" bls orangish tan fine silty sand with little angular pebbles, slightly damp	
				23" - 24" asphalt

DATA

**ADQM DATA REVIEW
NARRATIVE**

Site **BRE: BREVARD**

Project **SOIL 2014**

Project Reviewer **Wanda M. Davis**

Sampling Date December 1-5, 2014 and December 9-12, 2014

Analytical Protocol

<u>Laboratory</u>	<u>Analytical Method</u>	<u>Parameter(s)</u>
Eurofins Lancaster	SW846 8260B	Apx IX VOCs
Eurofins Lancaster	SW846 6010C/6020A/7470A	APX IX Metals
Eurofins Lancaster	SW846 8270D	Apx IX SVOCs + 1,4-Dioxane
Eurofins Lancaster	SW846 8082 A	PCBs
Eurofins Lancaster	SW846 8270D	Diphenyl Ether + Biphenyl
Eurofins Lancaster	SW846 8015B MOD	Glycols
Eurofins Lancaster	2540 G-1997	Moisture

Sample Receipt

The following items are noted for this data set:

- All samples were received Eurofins Lancaster Laboratories in satisfactory condition on December 4, 5, 11, 12, and 13, 2014. The cooler temperatures were as follows: 1.1, 0.8, 0.4, 0.7, 0.5, 1.4, 2.0, 0.7, 1.2, 0.2, and 0.3 degrees C. The ADQM chemist doesn't believe the data to be impacted since the samples were cold but not frozen upon receipt.
- The following sample id discrepancies were noted however the samples were logged in as indicated on the COC:
 - Two containers were received for SSP14-SWMU14-SS-10 but five was listed on the COC/no soil VOA vials received 12/13/14.
 - There was no label on two SSP14-SWMU13-SS-8 jars.
 - TB and TB-SS were listed on the COC but were not received at the lab 12/12/14.

Data Review

One hundred percent of the electronic data submitted for this project was reviewed via the automated DuPont Data Review (DDR) process. Overall the data is acceptable for use without qualification as reported by Eurofins Laboratories, with the exception of the forty non-detect results flagged **öRö**, rejected, unusable, due to low surrogate recovery (8082A), or low Relative Percent Recovery, RPR, within the LCS/LCSD (8270D) or low RPR within the MS/MSD (8270D, 6020A) and the fifty three Tin (6010C) results flagged **öBö**, due to method blank contamination. Twelve 8015C non-detect results were flagged **öUö**, due to low surrogate recovery and holding time being exceeded. Twelve 8270D, non-detect results were flagged **öUö**, estimated, due to low RPR within the LCS/LCSD/MS/MSD. Several non-detect

result were flagged $\delta UJ\delta$, estimated, due to low surrogate recovery (8082A, 8015C), low RPR within the LCS/LCSD (8270D), or low RPR within the MS/MSD (8270D, 6020A). Several results were qualified $\delta J\delta$, estimated, due to high RPR within the MS/MSD (6020A) or the quality review criteria between the REP (laboratory replicate) and the parent sample were exceeded (2540G-1997, 6020A, 6010C), or high Relative Percent Difference, RPD, between field duplicate and parent sample (8270D, 8082, 8260B) or low RPR within the MS/MSD (6020A, 6010C, 8270D). Results detected between the method detection limit (MDL) and practical quantitation limit (PQL) were qualified $\delta J\delta$ estimated. The DuPont Data Review (DDR) Narrative Report, which follows this cover letter, lists the samples that were qualified, the specific reasons for qualification, and potential bias in reported results.

DuPont Data Review (DDR)

The DDR is an internal review process used by the ADQM group to assist with the determination of data usability. The electronic data deliverables received from the laboratory are loaded into the Locus EIM[®] database and processed through a series of data quality checks, which are a combination of software (Locus EIM[®] database Data Validation Module (DVM)) and manual reviewer evaluations. The data is evaluated against the following data usability checks:

- Field and laboratory blank contamination
- US EPA hold time criteria
- Missing Quality Control (QC) samples
- Matrix spike(MS)/matrix spike duplicate (MSD) recoveries and the relative percent differences (RPDs) between these spikes
- Laboratory control sample(LCS)/control sample duplicate (LCSD) recoveries and the RPD between these spikes
- Surrogate spike recoveries for organic analyses
- RPD between field duplicate sample pairs
- RPD between laboratory replicates for inorganic analyses
- Difference / percent difference between total and dissolved sample pairs.

The DDR applies the following data evaluation qualifiers to analysis results, as warranted:

Qualifier	Definition
B	Not detected substantially above the level reported in the laboratory or field blanks.
R	Unusable result. Analyte may or may not be present in the sample.
J	Analyte present. Reported value may not be accurate or precise.
UJ	Not detected. Reporting limit may not be accurate or precise.

Please refer to the laboratory report for a description of the lab qualifiers.

DVM Narrative Report

Site: Brevard

Sampling Program: SOIL 2014

Validation Options: LABSTATS

Validation Reason Code: One or more surrogates had relative percent recovery (RPR) values less than the data rejection level. The detection limit is unusable.

Moisture represents the loss in weight of the sample after oven drying at 103 - 105 degrees Celsius. The moisture result reported is on an as-received basis.						

General Sample Comments

State of North Carolina Lab Certification No. 521

All QC is compliant unless otherwise noted. Please refer to the Quality Control Summary for overall QC performance data and associated samples.

Moisture represents the loss in weight of the sample after oven drying at 103 - 105 degrees Celsius. The moisture result reported is on an as-received basis.						

General Sample Comments

State of North Carolina Lab Certification No. 521

All QC is compliant unless otherwise noted. Please refer to the Quality Control Summary for overall QC performance data and associated samples.

The recovery for the sample internal standard is outside the QC acceptance limits. The following corrective action was taken: The sample was re-analyzed and the QC is again outside of the acceptance limits, indicating a matrix effect. The data is reported from the initial trial.

Moisture represents the loss in weight of the sample after oven drying at 103 - 105 degrees Celsius. The moisture result reported is on an as-received basis.						

General Sample Comments

State of North Carolina Lab Certification No. 521

All QC is compliant unless otherwise noted. Please refer to the Quality Control Summary for overall QC performance data and associated samples.

00111	Moisture	n.a.	13.3	0.50	0.50	1
Moisture represents the loss in weight of the sample after oven drying at 103 - 105 degrees Celsius. The moisture result reported is on an as-received basis.						

General Sample Comments

State of North Carolina Lab Certification No. 521

All QC is compliant unless otherwise noted. Please refer to the Quality Control Summary for overall QC performance data and associated samples.

00111	Moisture	n.a.	16.4	0.50	0.50	1
Moisture represents the loss in weight of the sample after oven drying at 103 - 105 degrees Celsius. The moisture result reported is on an as-received basis.						

General Sample Comments

State of North Carolina Lab Certification No. 521

All QC is compliant unless otherwise noted. Please refer to the Quality Control Summary for overall QC performance data and associated samples.

10726	4-Methylphenol	106-44-5	19	U 19	38	1
3-Methylphenol and 4-methylphenol cannot be resolved under the chromatographic conditions used for sample analysis. The result reported for 4-methylphenol represents the combined total of both compounds.						
10726	Naphthalene	91-20-3	4	U 4	19	1
10726	1,4-Naphthoquinone	130-15-4	950	U 950	3,800	1
The QC window for 1,4-naphthoquinone is advisory due to the erratic performance of the compound. The quantitated result is estimated.

Moisture represents the loss in weight of the sample after oven drying at 103 - 105 degrees Celsius. The moisture result reported is on an as-received basis.						

General Sample Comments

State of North Carolina Lab Certification No. 521

All QC is compliant unless otherwise noted. Please refer to the Quality Control Summary for overall QC performance data and associated samples.

Moisture represents the loss in weight of the sample after oven drying at 103 - 105 degrees Celsius. The moisture result reported is on an as-received basis.						

General Sample Comments

State of North Carolina Lab Certification No. 521

All QC is compliant unless otherwise noted. Please refer to the Quality Control Summary for overall QC performance data and associated samples.

Moisture represents the loss in weight of the sample after oven drying at 103 - 105 degrees Celsius. The moisture result reported is on an as-received basis.						

General Sample Comments

State of North Carolina Lab Certification No. 521

All QC is compliant unless otherwise noted. Please refer to the Quality Control Summary for overall QC performance data and associated samples.

Quality Control Summary

Client Name: CRG-E.I.DuPont de Nemours & Co
Reported: 12/19/14 at 08:54 AM

Group Number: 1523521

Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

All Inorganic Initial Calibration and Continuing Calibration Blanks met acceptable method criteria unless otherwise noted on the Analysis Report.

*- Outside of specification

** - This limit was used in the evaluation of the final result for the blank

- (1) The result for one or both determinations was less than five times the LOQ.
- (2) The unspiked result was more than four times the spike added.

4	DT121	0.5	DT	Wet	Y	Loose	N

Explanation of Symbols and Abbreviations

The following defines common symbols and abbreviations used in reporting technical data:

RL	Reporting Limit	BMQL	Below Minimum Quantitation Level
N.D.	none detected	MPN	Most Probable Number
TNTC	Too Numerous To Count	CP Units	cobalt-chloroplatinate units
IU	International Units	NTU	nephelometric turbidity units
umhos/cm	micromhos/cm	ng	nanogram(s)
C	degrees Celsius	F	degrees Fahrenheit
meq	milliequivalents	lb.	pound(s)
g	gram(s)	kg	kilogram(s)
µg	microgram(s)	mg	milligram(s)
mL	milliliter(s)	L	liter(s)
m3	cubic meter(s)	µL	microliter(s)
		pg/L	picogram/liter

< less than - The number following the sign is the limit of quantitation, the smallest amount of analyte which can be reliably determined using this specific test.

> greater than

ppm parts per million - One ppm is equivalent to one milligram per kilogram (mg/kg), or one gram per million grams. For aqueous liquids, ppm is usually taken to be equivalent to milligrams per liter (mg/l), because one liter of water has a weight very close to a kilogram. For gases or vapors, one ppm is equivalent to one microliter per liter of gas.

ppb parts per billion

Dry weight basis Results printed under this heading have been adjusted for moisture content. This increases the analyte weight concentration to approximate the value present in a similar sample without moisture. All other results are reported on an as-received basis.

Data Qualifiers:

C – result confirmed by reanalysis.

J - estimated value – The result is \geq the Method Detection Limit (MDL) and $<$ the Limit of Quantitation (LOQ).

U.S. EPA CLP Data Qualifiers:

Organic Qualifiers

Inorganic Qualifiers

A	TIC is a possible aldol-condensation product	B	Value is $<$ CRDL, but \geq IDL
B	Analyte was also detected in the blank	E	Estimated due to interference
C	Pesticide result confirmed by GC/MS	M	Duplicate injection precision not met
D	Compound quantitated on a diluted sample	N	Spike sample not within control limits
E	Concentration exceeds the calibration range of the instrument	S	Method of standard additions (MSA) used for calculation
N	Presumptive evidence of a compound (TICs only)	U	Compound was not detected
P	Concentration difference between primary and confirmation columns $>$ 25%	W	Post digestion spike out of control limits
U	Compound was not detected	*	Duplicate analysis not within control limits
X,Y,Z	Defined in case narrative	+	Correlation coefficient for MSA $<$ 0.995

Analytical test results meet all requirements of NELAC unless otherwise noted under the individual analysis.

Measurement uncertainty values, as applicable, are available upon request.

Tests results relate only to the sample tested. Clients should be aware that a critical step in a chemical or microbiological analysis is the collection of the sample. Unless the sample analyzed is truly representative of the bulk of material involved, the test results will be meaningless. If you have questions regarding the proper techniques of collecting samples, please contact us. We cannot be held responsible for sample integrity, however, unless sampling has been performed by a member of our staff. This report shall not be reproduced except in full, without the written approval of the laboratory.

Times are local to the area of activity. Parameters listed in the 40 CFR part 136 Table II as “analyze immediately” are not performed within 15 minutes.

WARRANTY AND LIMITS OF LIABILITY - In accepting analytical work, we warrant the accuracy of test results for the sample as submitted. THE FOREGOING EXPRESS WARRANTY IS EXCLUSIVE AND IS GIVEN IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED. WE DISCLAIM ANY OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING A WARRANTY OF FITNESS FOR PARTICULAR PURPOSE AND WARRANTY OF MERCHANTABILITY. IN NO EVENT SHALL EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL, LLC BE LIABLE FOR INDIRECT, SPECIAL, CONSEQUENTIAL, OR INCIDENTAL DAMAGES INCLUDING, BUT NOT LIMITED TO, DAMAGES FOR LOSS OF PROFIT OR GOODWILL REGARDLESS OF (A) THE NEGLIGENCE (EITHER SOLE OR CONCURRENT) OF EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL AND (B) WHETHER EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL HAS BEEN INFORMED OF THE POSSIBILITY OF SUCH DAMAGES. We accept no legal responsibility for the purposes for which the client uses the test results. No purchase order or other order for work shall be accepted by Eurofins Lancaster Laboratories Environmental which includes any conditions that vary from the Standard Terms and Conditions, and Eurofins Lancaster Laboratories Environmental hereby objects to any conflicting terms contained in any acceptance or order submitted by client.

Moisture represents the loss in weight of the sample after oven drying at 103 - 105 degrees Celsius. The moisture result reported is on an as-received basis.						

General Sample Comments

State of North Carolina Lab Certification No. 521

All QC is compliant unless otherwise noted. Please refer to the Quality Control Summary for overall QC performance data and associated samples.

The QC limits for methapyrilene are advisory only.

The recovery for Pronamide in the Laboratory Control Spike(s) is outside the QC acceptance limits as noted on the QC Summary. The client was contacted and the data reported.

The QC limits for methapyrilene are advisory only.

The recovery for Pronamide in the Laboratory Control Spike(s) is outside the QC acceptance limits as noted on the QC Summary. The client was contacted and the data reported.

Quality Control Summary

Client Name: CRG-E.I.DuPont de Nemours & Co
Reported: 12/30/14 at 02:15 PM

Group Number: 1525392

Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

All Inorganic Initial Calibration and Continuing Calibration Blanks met acceptable method criteria unless otherwise noted on the Analysis Report.

*- Outside of specification

** - This limit was used in the evaluation of the final result for the blank

(1) The result for one or both determinations was less than five times the LOQ.

(2) The unspiked result was more than four times the spike added.

*- Outside of specification

** - This limit was used in the evaluation of the final result for the blank

(1) The result for one or both determinations was less than five times the LOQ.

(2) The unspiked result was more than four times the spike added.
